<b>1 FTGL User Guide</b>	<b>1</b>
1.1 Introduction	1
1.2 Documentation	2
1.3 Additional information	2
1.4 FTGL tutorial	2
1.4.1 Starting to use FTGL	2
1.4.2 Choosing a font type	2
1.4.2.1 Raster fonts	2
1.4.2.2 Vector fonts	3
1.4.2.3 Textured fonts	3
1.4.3 Create font objects	3
1.4.3.1 in C	4
1.4.3.2 in C++	4
1.4.4 More font commands	4
1.4.4.1 Font metrics	4
1.4.4.2 Specifying a character map encoding	5
1.4.5 Sample font manager class	6
1.5 Frequently Asked Questions	7
1.5.1 FAQ	7
1.5.1.1 When I try to compile FTGL it complains about a missing file from the include: <code>#include &lt;ft2build.h&gt;</code>	7
1.5.1.2 Is it possible to map a font to a "unit" size? My application relies on the fonts being a certain "physical" height (in OpenGL coordinate space) rather than a point size in display space. Any thoughts/suggestions?	7

# Chapter 1

## FTGL User Guide

### 1.1 Introduction

OpenGL doesn't provide direct font support, so the application must use any of OpenGL's other features for font rendering, such as drawing bitmaps or pixmaps, creating texture maps containing an entire character set, drawing character outlines, or creating a 3D geometry for each character.

More information can be found on the OpenGL website:

- <http://www.opengl.org/resources/faq/technical/fonts.htm>
- <http://www.opengl.org/resources/features/fontsurvey/>

Most of these systems require a pre-processing stage to take the native fonts and convert them into a proprietary format.

FTGL was born out of the need to treat fonts in OpenGL applications just like any other application. For example when using Adobe Photoshop or Microsoft Word you don't need an intermediate pre-processing step to use high quality scalable fonts.

## 1.2 Documentation

- [FTGL tutorial](#)
- C API reference:
  - [FTGlyph.h](#)
  - [FTFont.h](#)
  - [FTLayout.h](#)
- C++ API reference:
  - class [FTGlyph](#)
  - class [FTFont](#)
  - class [FTLayout](#)

## 1.3 Additional information

- [Frequently Asked Questions](#)
- [Projects using FTGL](#)

## 1.4 FTGL tutorial

### 1.4.1 Starting to use FTGL

Only one header is required to use FTGL:

```
#include <FTGL/ftgl.h>
```

### 1.4.2 Choosing a font type

FTGL supports 6 font output types among 3 groups: raster fonts, vector fonts, and texture fonts which are a mixture of both. Each font type has its advantages and disadvantages.

#### 1.4.2.1 Raster fonts

Raster fonts are made of pixels painted directly on the viewport's framebuffer. They cannot be directly rotated or scaled.

- Bitmap fonts use 1-bit (2-colour) rasterised glyphs.
- Pixmap fonts use 8-bit (256 levels) rasterised glyphs.

***This is a GLBitmapFont object.***  
***This is a GLPixmapFont object.***

### 1.4.2.2 Vector fonts

Vector fonts are 3D objects that are rendered at the current matrix location. All position, scale, texture and material effects apply to vector fonts.

- Polygon fonts use planar triangle meshes and can be texture-mapped.
- Outline fonts use OpenGL lines.
- Extruded fonts are extruded polygon fonts, with the front, back and side meshes renderable separately to apply different effects and materials.

### 1.4.2.3 Textured fonts

Textured fonts are probably the most versatile types. They are fast, antialiased, and can be transformed just like any OpenGL primitive.

- Texture fonts use one texture per glyph. They are fast because glyphs are stored permanently in the video card's memory.
- Buffer fonts use one texture per line of text. They tend to be faster than texture fonts when the same line of text needs to be rendered for more than one frame.

## 1.4.3 Create font objects

Creating a font and displaying some text is really straightforward, be it in C or in C++.

### 1.4.3.1 in C

```
/* Create a pixmap font from a TrueType file. */
FTGLFont *font = ftglCreatePixmapFont("/home/user/Arial.ttf");

/* If something went wrong, bail out. */
if(!font)
    return -1;

/* Set the font size and render a small text. */
ftglSetFontFaceSize(font, 72, 72);
ftglRenderFont(font, "Hello World!", FTGL_RENDER_ALL);

/* Destroy the font object. */
ftglDestroyFont(font);
```

### 1.4.3.2 in C++

```
// Create a pixmap font from a TrueType file.
FTGLPixmapFont font("/home/user/Arial.ttf");

// If something went wrong, bail out.
if(font.Error())
    return -1;

// Set the font size and render a small text.
font.FaceSize(72);
font.Render("Hello World!");
```

The first 128 glyphs of the font (generally corresponding to the ASCII set) are preloaded. This means that usual text is rendered fast enough, but no memory is wasted loading glyphs that will not be used.

## 1.4.4 More font commands

### 1.4.4.1 Font metrics

If you ask a font to render at 0.0, 0.0 the bottom left most pixel or polygon may not be aligned to 0.0, 0.0. With `FTFont::Ascender()`, `FTFont::Descender()` and `FTFont::Advance()` an approximate bounding box can be calculated.

For an exact bounding box, use the `FTFont::BBox()` function. This function returns the extent of the volume containing 'string'. 0.0 on the y axis will be aligned with the font baseline.

#### 1.4.4.2 Specifying a character map encoding

From the FreeType documentation:

"By default, when a new face object is created, (FreeType) lists all the charmaps contained in the font face and selects the one that supports Unicode character codes if it finds one. Otherwise, it tries to find support for Latin-1, then ASCII."

It then gives up. In this case FTGL will set the charmap to the first it finds in the fonts charmap list. You can explicitly set the char encoding with `FTFont::CharMap()`.

Valid encodings as of FreeType 2.0.4 are:

- `ft_encoding_none`
- `ft_encoding_unicode`
- `ft_encoding_symbol`
- `ft_encoding_latin_1`
- `ft_encoding_latin_2`
- `ft_encoding_sjis`
- `ft_encoding_gb2312`
- `ft_encoding_big5`
- `ft_encoding_wansung`
- `ft_encoding_johab`
- `ft_encoding_adobe_standard`
- `ft_encoding_adobe_expert`
- `ft_encoding_adobe_custom`
- `ft_encoding_apple_roman`

For instance:

```
font.CharMap(ft_encoding_apple_roman);
```

This will return an error if the requested encoding can't be found in the font.

If your application uses Latin-1 characters, you can preload this character set using the following code:

```
// Create a pixmap font from a TrueType file.
FTGLPixmapFont font("/home/user/Arial.ttf");

// If something went wrong, bail out.
if(font.Error())
    return -1;

// Set the face size and the character map. If something went wrong, bail out.
font.FaceSize(72);
if(!font.CharMap(ft_encoding_latin_1))
    return -1;

// Create a string containing all characters between 128 and 255
// and preload the Latin-1 chars without rendering them.
char buf[129];
for(int i = 128; i < 256; i++)
{
    buf[i] = (char)(unsigned char)i;
}
buf[128] = '\0';

font.Advance(buf);
}
```

### 1.4.5 Sample font manager class

```

FTTextureFont* myFont = FTGLFontManager::Instance().GetFont("arial.ttf", 72);

#include <map>
#include <string>
#include <FTGL/ftgl.h>

using namespace std;

typedef map<string, FTFont*> FontList;
typedef FontList::const_iterator FontIter;

class FTGLFontManager
{
public:
    // NOTE
    // This is shown here for brevity. The implementation should be in the source
    // file otherwise your compiler may inline the function resulting in
    // multiple instances of FTGLFontManager
    static FTGLFontManager& Instance()
    {
        static FTGLFontManager tm;
        return tm;
    }

    ~FTGLFontManager()
    {
        FontIter font;
        for(font = fonts.begin(); font != fonts.end(); font++)
        {
            delete (*font).second;
        }

        fonts.clear();
    }

    FTFont* GetFont(const char *filename, int size)
    {
        char buf[256];
        sprintf(buf, "%s%i", filename, size);
        string fontKey = string(buf);

        FontIter result = fonts.find(fontKey);
        if(result != fonts.end())
        {
            LOGMSG("Found font %s in list", filename);
            return result->second;
        }

        FTFont* font = new FTTextureFont;

        string fullname = path + string(filename);

        if(!font->Open(fullname.c_str()))
        {
            LOGERROR("Font %s failed to open", fullname.c_str());
            delete font;
            return NULL;
        }

        if(!font->FaceSize(size))
        {
            LOGERROR("Font %s failed to set size %i", filename, size);
            delete font;
            return NULL;
        }

        fonts[fontKey] = font;

        return font;
    }

private:
    // Hide these 'cause this is a singleton.
    FTGLFontManager(){}
    FTGLFontManager(const FTGLFontManager&){};
    FTGLFontManager& operator = (const FTGLFontManager&){ return *this; };

    // container for fonts
    FontList fonts;
};

```

## 1.5 Frequently Asked Questions

### 1.5.1 FAQ

#### 1.5.1.1 When I try to compile FTGL it complains about a missing file from the include: #include <ft2build.h>

FTGL relies on FreeType 2 for opening and decoding font files. This include is the main include for FreeType. You will need to download Freetype 2 and install it. Then make sure that the FTGL project that you are using points to your FreeType installation.

#### 1.5.1.2 Is it possible to map a font to a "unit" size? My application relies on the fonts being a certain "physical" height (in OpenGL coordinate space) rather than a point size in display space. Any thoughts/suggestions?

We can do anything:) It would be easy to allow you to set the size in pixels, though I'm not sure this is what you want. Setting the size to 'OpenGL units' may be a bit harder. What does 1.0 in opengl space mean and how does that relate to point size? For one person it might mean scaling the font up, for someone else it may mean scaling down. Plus bitmaps and pixmaps have a pixel to pixel relationship that you can't change.

Here's some guidelines for vector and texture fonts. Take note that I say 'should' a lot :)

- One point in pixel space maps to 1 unit in OpenGL space, so a glyph that is 18 points high should be 18.0 units high.
- If you set an ortho projection to the window size and draw a glyph it's screen size should be the correct physical size ie a 72 point glyph on a 72dpi screen will be 1 inch high. Also if you set a perspective projection that maps 0.0 in the z axis to screen size you will get the same eg.

```
gluPerspective(90, window_height / 2, small_number, large_number);
```

So basically it all depends on your projection matrix. Obviously you can use glScale but I understand if you don't want to.

Couple of extra things to note:

- The quality of vector glyphs will not change when you change the size, ie. a really small polygon glyph up close will look exactly the same as a big one from far away. They both contain the same amount of data. This doesn't apply to texture fonts.
- Secondly, there is a bug in the advance/kerning code that will cause ugliness at really small point sizes. This is because the advance and kerning use ints so an advance of 0.4 will become zero. If this is going to be a probelm, I can fix this.

Early on I did a lot of head scratching over the OpenGL unit to font size thing because when I was first integrating FTGL into my engine the fonts weren't the size I was expecting. I was tempted to build in some scaling but I decided doing nothing was the best approach because you can't please everyone. Plus it's 'correct' as it is.

## 1.6 Projects using FTGL

To add your project to this list, please contact one of the FTGL developers at <http://sf.net/projects/ftgl>

Projects are listed in alphabetical order.

## 1.6.1 FTGL language bindings

### 1.6.1.1 FTGL#

FTGL# (<http://www.paskaluk.com/projects.php>) is a collection of .NET bindings for FTGL.

### 1.6.1.2 GIGuiA

GIGuiA (<http://sourceforge.net/projects/glguia/>) is a set of packages for Ada 2006 that can be used to create Graphical User Interfaces, relaying (almost) only on OpenGL. Hence should be rather platform-independent.

### 1.6.1.3 FTGL

Haskell FTGL (<http://www.haskell.org/haskellwiki/FTGL>) is a Haskell binding interface to FTGL.

### 1.6.1.4 Ruby FTGL

Ruby FTGL# (<http://rubyforge.org/projects/ruby-ftgl/>) is a collection of Ruby bindings for FTGL.

### 1.6.1.5 PyFTGL

PyFTGL (<http://code.google.com/p/pyftgl/>) wraps the functionality of FTGL into a Python module so that it can be used in conjunction with PyOpenGL.

### 1.6.1.6 Tcl3D

Tcl3D (<http://www.tcl3d.org>) offers the 3D functionality of OpenGL and other 3D libraries (including FTGL) at the Tcl scripting level.

## 1.6.2 Projects currently using FTGL

### 1.6.2.1 Agent World

Agent World (<http://code.google.com/p/agentw/>) provides tools for simulating and visualizing multi-agent systems and is specially designed for testing machine learning applications (and specially focused on Case Based Reasoning ones). It includes support for representing information using the Feature Term formalism, and provides a series of relational machine learning algorithms that can deal with them. The whole project is created in C++ to maximize efficiency, and uses OpenGL as the visualization library to ensure cross-platformness.

### 1.6.2.2 Amaltheia

Amaltheia (<http://home.gna.org/amaltheia/>) is a cross-platform game programming API that supports two backends, OpenGL and DirectX. The aim of the Amaltheia project is to create an intuitive and simple to use library, providing core 3d and 2d functionality in a platform independent manner. It also provides platform independence regarding basic network functions, input handling, threads and sound. Currently the GNU/Linux and the Windows OSes are supported.

### 1.6.2.3 Armagetron Advanced

Armagetron Advanced (<http://www.armagetronad.net/>) is a multiplayer game in 3d that attempts to emulate and expand on the lightcycle sequence from the movie Tron. It's an old school arcade game slung into the 21st century. Highlights include a customizable playing arena, HUD, unique graphics, and AI bots. For the more advanced player there are new game modes and a wide variety of physics settings to tweak as well.

### 1.6.2.4 Audicle

Audicle (<http://audicle.cs.princeton.edu/>) is an audio programming environment that integrates the programmability of the development environment with elements of the runtime environment. The result is a duct-taped intersection of a concurrent smart editor, compiler, virtual machine, and debugger.

### 1.6.2.5 Battlestar T.U.X.

Battlestar T.U.X. (<http://code.google.com/p/battlestar-tux/>) is a top-down scrolling shooter project.

### 1.6.2.6 BJS

BJS (<http://bjs.sourceforge.net/>) is a funny arcade 3D multiplayer tank battle. It is fully playable and very fun in multiplayer. Of course the single player is also possible. There is no story. You just get a tank and go shoot other players. Currently there are 5 different tanks, 6 maps, 9 powerups and 4 weapons.

### 1.6.2.7 Blender

Blender (<http://blender.org/>) is an integrated 3d suite for modelling, animation, rendering, post-production, interactive creation and playback (games).

### 1.6.2.8 Breve

Breve (<http://www.spiderland.org/>) is a free, open-source software package which makes it easy to build 3D simulations of multi-agent systems and artificial life. Using Python, or using a simple scripting language called steve, you can define the behaviors of agents in a 3D world and observe how they interact. breve includes physical simulation and collision detection so you can simulate realistic creatures, and an OpenGL display engine so you can visualize your simulated worlds.

#### 1.6.2.9 BZFlag

BZFlag (<http://BZFlag.org/>) is a 3D multi-player multiplatform tank battle game that allows users to play against each other in a network environment.

BZFlag uses FTGL as of version 2.99.

#### 1.6.2.10 Capture The Flag

Capture The Flag (<http://capturetf.sourceforge.net/>) is an open source, multi-platform, network game project.

#### 1.6.2.11 Cello

Cello (<http://common-lisp.net/project/cello/>) is a project to create an open-source, industrial-strength, portable GUI toolkit for Common Lisp. Its features include anti-aliased fonts, accelerated 2d- and 3d-graphics, a standard set of GUI widgets, easy construction of new widgets, and much more. Cello heavily utilizes Cells (a sister project on common-lisp.net), in addition to industry-standard technologies such as OpenGL, FreeType, and ImageMagick.

#### 1.6.2.12 Chimera

Chimera (<http://www.cgl.ucsf.edu/chimera/>) is a highly extensible program for interactive visualization and analysis of molecular structures and related data, including density maps, supramolecular assemblies, sequence alignments, docking results, trajectories, and conformational ensembles. High-quality images and animations can be generated.

#### 1.6.2.13 Cinepaint

Cinepaint (<http://www.cinepaint.org/>) is a deep paint image retouching tool that supports higher color fidelity than ordinary painting tools.

#### 1.6.2.14 Duel

Duel (<http://www.personal.rdg.ac.uk/~sir03me/play/code.html>) is a small overhead perspective spaceship game.

#### 1.6.2.15 EMAN2

EMAN2 (<http://blake.bcm.tmc.edu/eman/eman2/>) is a suite of scientific image processing tools aimed primarily at the transmission electron microscopy community.

#### 1.6.2.16 EMAN2

Empty Clip (<http://emptyclip.sourceforge.net/>) is a top-down 2D Action RPG.

#### 1.6.2.17 Freebox

Freebox (<http://freebox.sourceforge.net/>) is designed for use in a special type of computer called an 'HTPC', which is connected to a home-theatre system to watch XviD/DivX/DVD movies, play music (MP3, CD, whatever), play some emulated games, or whatever else you want to do with it.

#### 1.6.2.18 Gem

Gem (<http://gem.iem.at/>) is a loadable library for puredata, which adds OpenGL graphics rendering and animation to Pd. Pd is a graphical programming language and computer music system.

#### 1.6.2.19 GLMayan

GLMayan (<http://glmayan.sourceforge.net/>) is an OpenGL screensaver.

#### 1.6.2.20 Glover

Glover (<http://code.google.com/p/glover/>) is a movie player that renders the content using OpenGL allowing all kinds of special effects using fragment shaders. The movie decoding is done using ffmpeg.

#### 1.6.2.21 Ivf++

Ivf++ (<http://ivfplusplus.sourceforge.net/>) is a C++ library encapsulating OpenGL functionality. The primary goal is to make it easier to use the OpenGL library in interactive 3D applications. The second goal is extendibility, providing a set of well defined base classes for different object types to build new classes on. The third goal is portability, primarily between Linux and Windows, but the library should also be easily ported to Mac OS X.

#### 1.6.2.22 Jahshaka

Jashaka (<http://jahshaka.org/>) is an advanced video editing, animation, visual effects, painting and music tool.

#### 1.6.2.23 Karaoke FX

Karaoke FX (<http://jeanchristophe.duber.free.fr/karaokefx/>) is a midifile player that can display lyrics in synch with the sound so as it can be used for karaoke. It relies on plugins for midi output devices as for lyrics display.

#### 1.6.2.24 Libinstrudeo

Libinstrudeo (<http://sourceforge.net/projects/libinstrudeo>), initially written for the Screen↔Kast program, provides the necessary logic to capture screen recordings and to process them. Includes a soap-client for the webservice at captorials.com that enables you to share your recordings.

#### 1.6.2.25 Light Speed!

Light Speed! (<http://lightspeed.sourceforge.net/>) is an OpenGL-based program which illustrates the effects of special relativity on the appearance of moving objects. When an object accelerates past a few million meters per second, these effects begin to grow noticeable, becoming more and more pronounced as the speed of light is approached. These relativistic effects are viewpoint-dependent, and include shifts in length, object hue, brightness and shape.

#### 1.6.2.26 MySQL GUI Tools

MySQL GUI Tools (<http://dev.mysql.com/downloads/gui-tools/5.0.html>) is a collection of tools for the MySQL database. It consists of MySQL Administrator, MySQL Query Browser and MySQL Migration Toolkit.

#### 1.6.2.27 OctPlot

OctPlot (<http://octplot.sourceforge.net/>) is a graphics package for Octave, the free alternative to MATLAB. It provides high quality PostScript and on-screen graphics.

#### 1.6.2.28 Open ActiveWrl

Open ActiveWrl (<http://open-activewrl.sourceforge.net/>) is a software development toolkit based on a generic software development approach that allows the implementation VRML/X3D browser components. These browser components can run within an conventional application or can be linked together for the implementation of parallel immersive VR setups.

#### 1.6.2.29 OpenEagles

OpenEagles (<http://www.openeaagles.org/>) is a multi-platform simulation framework targeted to help simulation engineers and software developers build robust, scalable, virtual, constructive, stand-alone, and distributed simulation applications. It has been used extensively to build applications that demand real-time performance. This includes applications to conduct human factor studies, operator training, and the development of complete distributed virtual simulation systems. OpenEagles has also been used to build stand-alone and distributed constructive applications oriented at system analysis.

#### 1.6.2.30 OpenGC

OpenGC (<http://www.opengc.org/>) is a multi-platform, multi-simulator, open-source C++ tool for developing and implementing high quality glass cockpit displays for simulated flightdecks.

#### 1.6.2.31 OpenSG

OpenSG (<http://www.opensg.org/>) is a portable scenegraph system to create realtime graphics programs, e.g. for virtual reality applications.

### 1.6.2.32 Panthera

Panthera (<http://sourceforge.net/projects/panthera>) is a C++ framework for interactive visualization, manipulation, and editing of volume data. Applications developed on top of Panthera can utilize both desktop and immersive user interface devices, such as position trackers and haptic displays.

### 1.6.2.33 Planet Penguin Racer

PlanetPenguin Racer (<http://developer.berlios.de/projects/ppracer/>) is a simple OpenGL racing game featuring Tux, the Linux mascot. The goal of the game is to slide down a snow- and ice-covered mountain as quickly as possible, avoiding the trees and rocks that will slow you down.

### 1.6.2.34 projectM

projectM (<http://projectm.sourceforge.net/>) is a music visualizer which uses OpenGL for hardware acceleration. It is compatible with Milkdrop presets.

### 1.6.2.35 Puzzle Bobble 3D

Puzzle Bobble 3D (<http://homepage.mac.com/eric.lee/puzzle/>) is a 3D video game for Linux. The game is similar to Tetris/Connect 4: connect balls of the same colour to make them disappear. Puzzle Bobble 3D is based on an already popular arcade game of the same name by Taito Corporation (see links section at the bottom of this page), but this particular variant is played in a 3D environment (hence the name).

### 1.6.2.36 ROOT

ROOT (<http://root.cern.ch/>) is an object-oriented data analysis framework.

### 1.6.2.37 SCIRun

SCIRun (<http://software.sci.utah.edu/scirun.html>) is a Problem Solving Environment (PSE), for modeling, simulation and visualization of scientific problems. It is available for free and open source.

### 1.6.2.38 TINE

TINE, or TINE Is Not ELITE (<http://tine.sunsite.dk/en/index.html>) is an open source cross-platform remake of the classic space adventure game ELITE.

### 1.6.2.39 Tiny Planet

Tiny Planet (<http://www.duberga.net/tinyplanet/>) is a real-time OpenGL viewer of detailed earth texture such as BlueMarble from Earth Observatory (NASA) or any other planet texture. Vectorial data such as points of interest, boundaries, rivers can be superimposed to the texture.

#### 1.6.2.40 Truevision

Truevision (<http://truevision.sourceforge.net/>) is a 3D modeler for GNOME.

#### 1.6.2.41 Tulip

Tulip (<http://tulip.labri.fr/>) is a system dedicated to the visualization of huge graphs. It is capable of managing graphs with up to 500,000 nodes and edges on relatively modest hardware (eg. 600MHz Pentium III, 256MB RAM).

#### 1.6.2.42 Ubit

Ubit (<http://www.infres.enst.fr/~elc/ubit/>) Ubit is a new GUI toolkit that combines the advantages of scene graph and widget based toolkits. The Ubit3D extension makes it possible to display 2D GUIs in a 3D space.

#### 1.6.2.43 VRS

The Virtual Rendering System (<http://www.hpi.uni-potsdam.de/vrs/>) is a computer graphics software library for constructing interactive 3D applications. It provides a large collection of 3D rendering components which facilitate implementing 3D graphics applications and experimenting with 3D graphics and imaging algorithms.

#### 1.6.2.44 VTK

VTK, the Visualization Toolkit (<http://www.vtk.org/>), is an object oriented, high level library that allows one to easily write C++ programs, Tcl, Python and Java scripts that do 3D visualization.

#### 1.6.2.45 XLock

XLock (<http://www.tux.org/~bagleyd/xlockmore.html>) is a screensaver and screen locking utility with additional OpenGL and XPM modes.

### 1.6.3 Projects that used to use FTGL

#### 1.6.3.1 GNU Backgammon

GNU Backgammon (<http://www.gnubg.org/>) was using FTGL until version 0.14.3+20060520-1.

#### 1.6.3.2 OpenSceneGraph

OpenSceneGraph (<http://www.openscenegraph.org/projects/osg>) is an open source high performance 3D graphics toolkit, used by application developers in fields such as visual simulation, games, virtual reality, scientific visualization and modelling. Written entirely in Standard C++ and OpenGL it runs on all Windows platforms, OSX, GNU/Linux, IRIX, Solaris, HP-Ux, AIX and FreeBSD operating systems.

#### 1.6.3.3 Teddy

Teddy (<http://teddy.sourceforge.net/>) was a 3D graphics library. The main purpose was to be a simple scene graph manager.

#### 1.6.3.4 VigiPac

VigiPac (<http://vigipac.sourceforge.net/>) was a three-dimensional Pacman clone with multiplayer support, written in the C++ language.

*Combine two bounding boxes.*
- void [SetDepth](#) (float depth)
- [FTPoint](#) const [Upper](#) () const
- [FTPoint](#) const [Lower](#) () const

#### 4.1.1 Detailed Description

[FTBBBox](#) is a convenience class for handling bounding boxes.

Definition at line [42](#) of file [FTBBBox.h](#).

## 4.1.2 Constructor & Destructor Documentation

### 4.1.2.1 FTBBox() [1/4]

```
FTBBox::FTBBox () [inline]
```

Default constructor.

Bounding box is set to zero.

Definition at line 48 of file [FTBBox.h](#).

Referenced by [operator+=\(\(\)\)](#), and [operator|=\(\(\)\)](#).

### 4.1.2.2 FTBBox() [2/4]

```
FTBBox::FTBBox (
    float lx,
    float ly,
    float lz,
    float ux,
    float uy,
    float uz) [inline]
```

Constructor.

Definition at line 56 of file [FTBBox.h](#).

### 4.1.2.3 FTBBox() [3/4]

```
FTBBox::FTBBox (
    FTPoint l,
    FTPoint u) [inline]
```

Constructor.

Definition at line 64 of file [FTBBox.h](#).

### 4.1.2.4 FTBBox() [4/4]

```
FTBBox::FTBBox (
    FT_GlyphSlot glyph) [inline]
```

Constructor.

Extracts a bounding box from a freetype glyph. Uses the control box for the glyph. [FT\\_Glyph\\_Get\\_CBox\(\)](#)

#### Parameters

<i>glyph</i>	A freetype glyph
--------------	------------------

Definition at line 75 of file [FTBBox.h](#).

#### 4.1.2.5 ~FTBBox()

```
FTBBox::~~FTBBox () [inline]
```

Destructor.

Definition at line 93 of file [FTBBox.h](#).

### 4.1.3 Member Function Documentation

#### 4.1.3.1 Invalidate()

```
void FTBBox::Invalidate () [inline]
```

Mark the bounds invalid by setting all lower dimensions greater than the upper dimensions.

Definition at line 100 of file [FTBBox.h](#).

#### 4.1.3.2 IsValid()

```
bool FTBBox::IsValid () [inline]
```

Determines if this bounding box is valid.

##### Returns

True if all lower values are  $\leq$  the corresponding upper values.

Definition at line 112 of file [FTBBox.h](#).

#### 4.1.3.3 Lower()

```
FTPoint const FTBBox::Lower () const [inline]
```

Definition at line 165 of file [FTBBox.h](#).

Referenced by [FTFont::BBox\(\)](#), and [FTFont::BBox\(\)](#).

#### 4.1.3.4 operator+=()

```
FTBBox & FTBBox::operator+= (  
    const FTPoint vector) [inline]
```

Move the Bounding Box by a vector.

**Parameters**

<i>vector</i>	The vector to move the bbox in 3D space.
---------------	--

Definition at line 124 of file [FTBBBox.h](#).

References [FTBBBox\(\)](#).

**4.1.3.5 operator" |=()**

```
FTBBBox & FTBBBox::operator|= (
    const FTBBBox & bbox) [inline]
```

Combine two bounding boxes.

The result is the smallest bounding box containing the two original boxes.

**Parameters**

<i>bbox</i>	The bounding box to merge with the second one.
-------------	--

Definition at line 138 of file [FTBBBox.h](#).

References [FTBBBox\(\)](#), [FTPoint::X\(\)](#), [FTPoint::Y\(\)](#), and [FTPoint::Z\(\)](#).

**4.1.3.6 SetDepth()**

```
void FTBBBox::SetDepth (
    float depth) [inline]
```

Definition at line 150 of file [FTBBBox.h](#).

**4.1.3.7 Upper()**

```
FTPoint const FTBBBox::Upper () const [inline]
```

Definition at line 159 of file [FTBBBox.h](#).

Referenced by [FTFont::BBox\(\)](#), and [FTFont::BBox\(\)](#).

The documentation for this class was generated from the following file:

- [FTBBBox.h](#)

## 4.2 FTBitmapFont Class Reference

[FTBitmapFont](#) is a specialisation of the [FTFont](#) class for handling Bitmap fonts.

```
#include <FTGLBitmapFont.h>
```

Inheritance diagram for FTBitmapFont:

### Public Member Functions

- [FTBitmapFont](#) (const char \*fontFilePath)  
*Open and read a font file.*
- [FTBitmapFont](#) (const unsigned char \*pBufferBytes, size\_t bufferSizeInBytes)  
*Open and read a font from a buffer in memory.*
- [~FTBitmapFont](#) ()  
*Destructor.*

### Public Member Functions inherited from [FTFont](#)

- virtual [~FTFont](#) ()
- virtual bool [Attach](#) (const char \*fontFilePath)  
*Attach auxilliary file to font e.g font metrics.*
- virtual bool [Attach](#) (const unsigned char \*pBufferBytes, size\_t bufferSizeInBytes)  
*Attach auxilliary data to font e.g font metrics, from memory.*
- virtual void [GlyphLoadFlags](#) (FT\_Int flags)  
*Set the glyph loading flags.*
- virtual bool [CharMap](#) (FT\_Encoding encoding)  
*Set the character map for the face.*
- virtual unsigned int [CharMapCount](#) () const  
*Get the number of character maps in this face.*
- virtual FT\_Encoding \* [CharMapList](#) ()  
*Get a list of character maps in this face.*
- virtual bool [FaceSize](#) (const unsigned int size, const unsigned int res=72)  
*Set the char size for the current face.*
- virtual unsigned int [FaceSize](#) () const  
*Get the current face size in points (1/72 inch).*
- virtual void [Depth](#) (float depth)  
*Set the extrusion distance for the font.*
- virtual void [Outset](#) (float outset)  
*Set the outset distance for the font.*
- virtual void [Outset](#) (float front, float back)  
*Set the front and back outset distances for the font.*
- virtual void [UseDisplayList](#) (bool useList)  
*Enable or disable the use of Display Lists inside FTGL.*

- virtual float [Ascender](#) () const  
*Get the global ascender height for the face.*
- virtual float [Descender](#) () const  
*Gets the global descender height for the face.*
- virtual float [LineHeight](#) () const  
*Gets the line spacing for the font.*
- virtual [FTBBox](#) [BBox](#) (const char \*string, const int len=-1, [FTPoint](#) position=[FTPoint](#)(), [FTPoint](#) spacing=[FTPoint](#)())  
*Get the bounding box for a string.*
- void [BBox](#) (const char \*string, float &llx, float &lly, float &llz, float &urx, float &ury, float &urz)  
*Get the bounding box for a string (deprecated).*
- virtual [FTBBox](#) [BBox](#) (const wchar\_t \*string, const int len=-1, [FTPoint](#) position=[FTPoint](#)(), [FTPoint](#) spacing=[FTPoint](#)())  
*Get the bounding box for a string.*
- void [BBox](#) (const wchar\_t \*string, float &llx, float &lly, float &llz, float &urx, float &ury, float &urz)  
*Get the bounding box for a string (deprecated).*
- virtual float [Advance](#) (const char \*string, const int len=-1, [FTPoint](#) spacing=[FTPoint](#)())  
*Get the advance for a string.*
- virtual float [Advance](#) (const wchar\_t \*string, const int len=-1, [FTPoint](#) spacing=[FTPoint](#)())  
*Get the advance for a string.*
- virtual [FTPoint](#) [Render](#) (const char \*string, const int len=-1, [FTPoint](#) position=[FTPoint](#)(), [FTPoint](#) spacing=[FTPoint](#)(), int renderMode=[FTGL::RENDER\\_ALL](#))  
*Render a string of characters.*
- virtual [FTPoint](#) [Render](#) (const wchar\_t \*string, const int len=-1, [FTPoint](#) position=[FTPoint](#)(), [FTPoint](#) spacing=[FTPoint](#)(), int renderMode=[FTGL::RENDER\\_ALL](#))  
*Render a string of characters.*
- virtual FT\_Error [Error](#) () const  
*Queries the Font for errors.*

### Protected Member Functions

- virtual [FTGlyph](#) \* [MakeGlyph](#) (FT\_GlyphSlot slot)  
*Construct a glyph of the correct type.*

### Protected Member Functions inherited from [FTFont](#)

- [FTFont](#) (char const \*fontFilePath)  
*Open and read a font file.*
- [FTFont](#) (const unsigned char \*pBufferBytes, size\_t bufferSizeInBytes)  
*Open and read a font from a buffer in memory.*

## 4.2.1 Detailed Description

[FTBitmapFont](#) is a specialisation of the [FTFont](#) class for handling Bitmap fonts.

See also

[FTFont](#)

Definition at line 45 of file [FTGLBitmapFont.h](#).

## 4.2.2 Constructor & Destructor Documentation

### 4.2.2.1 FTBitmapFont() [1/2]

```
FTBitmapFont::FTBitmapFont (
    const char * fontFilePath)
```

Open and read a font file.

Sets Error flag.

#### Parameters

<i>fontFilePath</i>	font file path.
---------------------	-----------------

### 4.2.2.2 FTBitmapFont() [2/2]

```
FTBitmapFont::FTBitmapFont (
    const unsigned char * pBufferBytes,
    size_t bufferSizeInBytes)
```

Open and read a font from a buffer in memory.

Sets Error flag. The buffer is owned by the client and is NOT copied by [FTGL](#). The pointer must be valid while using [FTGL](#).

#### Parameters

<i>pBufferBytes</i>	the in-memory buffer
<i>bufferSizeInBytes</i>	the length of the buffer in bytes

### 4.2.2.3 ~FTBitmapFont()

```
FTBitmapFont::~FTBitmapFont ()
```

Destructor.

## 4.2.3 Member Function Documentation

### 4.2.3.1 MakeGlyph()

```
virtual FTGlyph * FTBitmapFont::MakeGlyph (
    FT_GlyphSlot slot) [protected], [virtual]
```

Construct a glyph of the correct type.

Clients must override the function and return their specialised [FTGlyph](#).

**Parameters**

<i>slot</i>	A FreeType glyph slot.
-------------	------------------------

**Returns**

An FT\*\*\*\*Glyph or `null` on failure.

Implements [FTFont](#).

The documentation for this class was generated from the following file:

- [FTGLBitmapFont.h](#)

## 4.3 FTBitmapGlyph Class Reference

[FTBitmapGlyph](#) is a specialisation of [FTGlyph](#) for creating bitmaps.

```
#include <FTBitmapGlyph.h>
```

Inheritance diagram for FTBitmapGlyph:

**Public Member Functions**

- [FTBitmapGlyph](#) (FT\_GlyphSlot glyph)  
*Constructor.*
- virtual [~FTBitmapGlyph](#) ()  
*Destructor.*
- virtual const [FTPoint](#) & [Render](#) (const [FTPoint](#) &pen, int renderMode)  
*Render this glyph at the current pen position.*

**Public Member Functions inherited from [FTGlyph](#)**

- virtual [~FTGlyph](#) ()  
*Destructor.*
- virtual float [Advance](#) () const  
*Return the advance width for this glyph.*
- virtual const [FTBBox](#) & [BBox](#) () const  
*Return the bounding box for this glyph.*
- virtual FT\_Error [Error](#) () const  
*Queries for errors.*

## Additional Inherited Members

## Protected Member Functions inherited from FTGlyph

- [FTGlyph](#) (FT\_GlyphSlot glyph)  
*Create a glyph.*

### 4.3.1 Detailed Description

[FTBitmapGlyph](#) is a specialisation of [FTGlyph](#) for creating bitmaps.

Definition at line 42 of file [FTBitmapGlyph.h](#).

### 4.3.2 Constructor & Destructor Documentation

#### 4.3.2.1 FTBitmapGlyph()

```
FTBitmapGlyph::FTBitmapGlyph (  
    FT_GlyphSlot glyph)
```

Constructor.

#### Parameters

<i>glyph</i>	The Freetype glyph to be processed
--------------	------------------------------------

#### 4.3.2.2 ~FTBitmapGlyph()

```
virtual FTBitmapGlyph::~FTBitmapGlyph () [virtual]
```

Destructor.

### 4.3.3 Member Function Documentation

#### 4.3.3.1 Render()

```
virtual const FTPoint & FTBitmapGlyph::Render (  
    const FTPoint & pen,  
    int renderMode) [virtual]
```

Render this glyph at the current pen position.

#### Parameters

<i>pen</i>	The current pen position.
------------	---------------------------

<code>renderMode</code>	Render mode to display
-------------------------	------------------------

#### Returns

The advance distance for this glyph.

Implements [FTGlyph](#).

The documentation for this class was generated from the following file:

- [FTBitmapGlyph.h](#)

## 4.4 FTBuffer Class Reference

[FTBuffer](#) is a helper class for pixel buffers.

```
#include <FTBuffer.h>
```

### Public Member Functions

- [FTBuffer](#) ()  
*Default constructor.*
- [~FTBuffer](#) ()  
*Destructor.*
- [FTPoint Pos](#) () const  
*Get the pen's position in the buffer.*
- void [Pos](#) ([FTPoint](#) arg)  
*Set the pen's position in the buffer.*
- void [Size](#) (int w, int h)  
*Set the buffer's size.*
- int [Width](#) () const  
*Get the buffer's width.*
- int [Height](#) () const  
*Get the buffer's height.*
- unsigned char \* [Pixels](#) () const  
*Get the buffer's direct pixel buffer.*

### 4.4.1 Detailed Description

[FTBuffer](#) is a helper class for pixel buffers.

It provides the interface between [FTBufferFont](#) and [FTBufferGlyph](#) to optimise rendering operations.

See also

[FTBufferGlyph](#)  
[FTBufferFont](#)

Definition at line 45 of file [FTBuffer.h](#).

## 4.4.2 Constructor & Destructor Documentation

### 4.4.2.1 FTBuffer()

```
FTBuffer::FTBuffer ()
```

Default constructor.

### 4.4.2.2 ~FTBuffer()

```
FTBuffer::~~FTBuffer ()
```

Destructor.

## 4.4.3 Member Function Documentation

### 4.4.3.1 Height()

```
int FTBuffer::Height () const [inline]
```

Get the buffer's height.

#### Returns

The buffer's height, in pixels.

Definition at line 98 of file [FTBuffer.h](#).

### 4.4.3.2 Pixels()

```
unsigned char * FTBuffer::Pixels () const [inline]
```

Get the buffer's direct pixel buffer.

#### Returns

A read-write pointer to the buffer's pixels.

Definition at line 105 of file [FTBuffer.h](#).

### 4.4.3.3 Pos() [1/2]

```
FTPoint FTBuffer::Pos () const [inline]
```

Get the pen's position in the buffer.

---

#### Returns

Generated by Doxygen

The pen's position as an [FTPoint](#) object.

Definition at line 62 of file [FTBuffer.h](#).

**Parameters**

<i>arg</i>	An <a href="#">FTPoint</a> object with the desired pen's position.
------------	--

Definition at line 73 of file [FTBuffer.h](#).

**4.4.3.5 Size()**

```
void FTBuffer::Size (  
    int w,  
    int h)
```

Set the buffer's size.

**Parameters**

<i>w</i>	The buffer's desired width, in pixels.
<i>h</i>	The buffer's desired height, in pixels.

**4.4.3.6 Width()**

```
int FTBuffer::Width () const [inline]
```

Get the buffer's width.

**Returns**

The buffer's width, in pixels.

Definition at line 91 of file [FTBuffer.h](#).

The documentation for this class was generated from the following file:

- [FTBuffer.h](#)

**4.5 FTBufferFont Class Reference**

[FTBufferFont](#) is a specialisation of the [FTFont](#) class for handling memory buffer fonts.

```
#include <FTBufferFont.h>
```

Inheritance diagram for FTBufferFont:

## Public Member Functions

- [FTFont](#) (const unsigned char \*pBufferBytes, size\_t bufferSizeInBytes)

*Open and read a font from a buffer in memory.*

## 4.5.1 Detailed Description

[FTBufferFont](#) is a specialisation of the [FTFont](#) class for handling memory buffer fonts.

See also

[FTFont](#)

Definition at line 43 of file [FTBufferFont.h](#).

## 4.5.2 Constructor & Destructor Documentation

### 4.5.2.1 FTBufferFont() [1/2]

```
FTBufferFont::FTBufferFont (
    const char * fontFilePath)
```

Open and read a font file.

Sets Error flag.

**Parameters**

<i>fontFilePath</i>	font file path.
---------------------	-----------------

**4.5.2.2 FTBufferFont() [2/2]**

```
FTBufferFont::FTBufferFont (
    const unsigned char * pBufferBytes,
    size_t bufferSizeInBytes)
```

Open and read a font from a buffer in memory.

Sets Error flag. The buffer is owned by the client and is NOT copied by [FTGL](#). The pointer must be valid while using [FTGL](#).

**Parameters**

<i>pBufferBytes</i>	the in-memory buffer
<i>bufferSizeInBytes</i>	the length of the buffer in bytes

**4.5.2.3 ~FTBufferFont()**

```
FTBufferFont::~~FTBufferFont ()
```

Destructor.

**4.5.3 Member Function Documentation****4.5.3.1 MakeGlyph()**

```
virtual FTGlyph * FTBufferFont::MakeGlyph (
    FT_GlyphSlot slot) [protected], [virtual]
```

Construct a glyph of the correct type.

Clients must override the function and return their specialised [FTGlyph](#).

**Parameters**

<i>slot</i>	A FreeType glyph slot.
-------------	------------------------

**Returns**

An FT\*\*\*\*Glyph or `null` on failure.

Implements [FTFont](#).

The documentation for this class was generated from the following file:

- [FTBufferFont.h](#)

## 4.6 FTBufferGlyph Class Reference

[FTBufferGlyph](#) is a specialisation of [FTGlyph](#) for memory buffer rendering.

#### 4.6.1 Detailed Description

[FTBufferGlyph](#) is a specialisation of [FTGlyph](#) for memory buffer rendering.

Definition at line 40 of file [FTBufferGlyph.h](#).

**Parameters**

<i>glyph</i>	The Freetype glyph to be processed
<i>buffer</i>	An <a href="#">FTBuffer</a> object in which to render the glyph.

**4.6.2.2 ~FTBufferGlyph()**

```
virtual FTBufferGlyph::~FTBufferGlyph () [virtual]
```

Destructor.

**4.6.3 Member Function Documentation****4.6.3.1 Render()**

```
virtual const FTPoint & FTBufferGlyph::Render (
    const FTPoint & pen,
    int renderMode) [virtual]
```

Render this glyph at the current pen position.

**Parameters**

<i>pen</i>	The current pen position.
<i>renderMode</i>	Render mode to display

**Returns**

The advance distance for this glyph.

Implements [FTGlyph](#).

The documentation for this class was generated from the following file:

- [FTBufferGlyph.h](#)

**4.7 FTEXtrudeFont Class Reference**

[FTEXtrudeFont](#) is a specialisation of the [FTFont](#) class for handling extruded Polygon fonts.

```
#include <FTGLExtrdFont.h>
```

## 4.7.2 Constructor & Destructor Documentation

### 4.7.2.1 FTExtrudeFont() [1/2]

```
FTExtrudeFont::FTExtrudeFont (
    const char * fontFilePath)
```

Open and read a font file.

Sets Error flag.

**Parameters**

<i>fontFilePath</i>	font file path.
---------------------	-----------------

**4.7.2.2 FTEXtrudeFont() [2/2]**

```
FTEXtrudeFont::FTEXtrudeFont (
    const unsigned char * pBufferBytes,
    size_t bufferSizeInBytes)
```

Open and read a font from a buffer in memory.

Sets Error flag. The buffer is owned by the client and is NOT copied by [FTGL](#). The pointer must be valid while using [FTGL](#).

**Parameters**

<i>pBufferBytes</i>	the in-memory buffer
<i>bufferSizeInBytes</i>	the length of the buffer in bytes

**4.7.2.3 ~FTEXtrudeFont()**

```
FTEXtrudeFont::~~FTEXtrudeFont ()
```

Destructor.

**4.7.3 Member Function Documentation****4.7.3.1 MakeGlyph()**

```
virtual FTGlyph * FTEXtrudeFont::MakeGlyph (
    FT_GlyphSlot slot) [protected], [virtual]
```

Construct a glyph of the correct type.

Clients must override the function and return their specialised [FTGlyph](#).

**Parameters**

<i>slot</i>	A FreeType glyph slot.
-------------	------------------------

**Returns**

An FT\*\*\*\*Glyph or `null` on failure.

Implements [FTFont](#).

#### 4.8.1 Detailed Description

[FTexturdeGlyph](#) is a specialisation of [FTGlyph](#) for creating tessellated extruded polygon glyphs.

Definition at line 43 of file [FTexturdeGlyph.h](#).

## 4.8.2 Constructor & Destructor Documentation

### 4.8.2.1 FTEXtrudeGlyph()

```
FTEXtrudeGlyph::FTEXtrudeGlyph (
    FT_GlyphSlot glyph,
    float depth,
    float frontOutset,
    float backOutset,
    bool useDisplayList)
```

Constructor.

Sets the Error to Invalid\_Outline if the glyph isn't an outline.

#### Parameters

<i>glyph</i>	The Freetype glyph to be processed
<i>depth</i>	The distance along the z axis to extrude the glyph
<i>frontOutset</i>	outset contour size
<i>backOutset</i>	outset contour size
<i>useDisplayList</i>	Enable or disable the use of Display Lists for this glyph <code>true</code> turns ON display lists. <code>false</code> turns OFF display lists.

### 4.8.2.2 ~FTEXtrudeGlyph()

```
virtual FTEXtrudeGlyph::~FTEXtrudeGlyph () [virtual]
```

Destructor.

## 4.8.3 Member Function Documentation

### 4.8.3.1 Render()

```
virtual const FTPoint & FTEXtrudeGlyph::Render (
    const FTPoint & pen,
    int renderMode) [virtual]
```

Render this glyph at the current pen position.

#### Parameters

<i>pen</i>	The current pen position.
<i>renderMode</i>	Render mode to display

#### Returns

The advance distance for this glyph.

Implements [FTGlyph](#).

The documentation for this class was generated from the following file:

- [FTEXtrdGlyph.h](#)

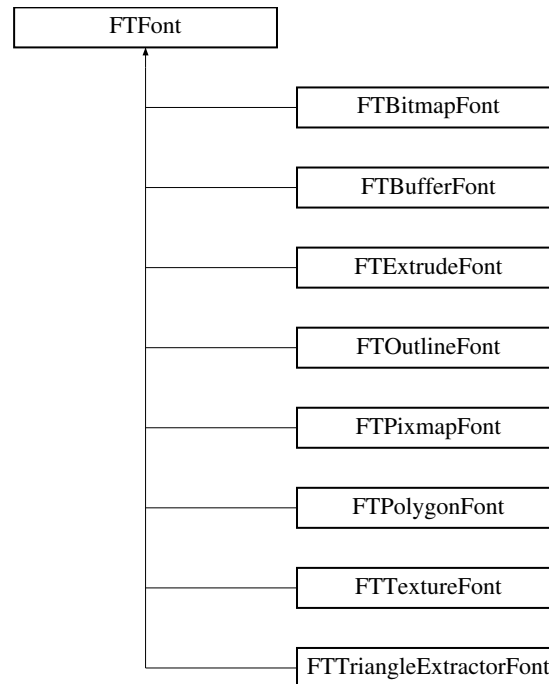

## 4.9 FTFont Class Reference

[FTFont](#) is the public interface for the [FTGL](#) library.

### 4.9.1 Detailed Description

[FTFont](#) is the public interface for the [FTGL](#) library.

Specific font classes are derived from this class. It uses the helper classes [FTFace](#) and [FTSize](#) to access the FreeType library. This class is abstract and deriving classes must implement the protected `MakeGlyph` function to create glyphs of the appropriate type.

It is good practice after using these functions to test the error code returned. `FT_Error` [Error\(\)](#). Check the freetype file `fterrdef.h` for error definitions.

See also

[FTFace](#)

[FTSize](#)

Definition at line 56 of file [FTFont.h](#).

### 4.9.2 Constructor & Destructor Documentation

#### 4.9.2.1 FTFont() [1/2]

```
FTFont::FTFont (
    char const * fontFilePath) [protected]
```

Open and read a font file.

Sets Error flag.

##### Parameters

<i>fontFilePath</i>	font file path.
---------------------	-----------------

Referenced by [FTTriangleExtractorFont](#).

#### 4.9.2.2 FTFont() [2/2]

```
FTFont::FTFont (
    const unsigned char * pBufferBytes,
    size_t bufferSizeInBytes) [protected]
```

Open and read a font from a buffer in memory.

Sets Error flag. The buffer is owned by the client and is NOT copied by [FTGL](#). The pointer must be valid while using [FTGL](#).

##### Parameters

<i>pBufferBytes</i>	the in-memory buffer
---------------------	----------------------

<i>bufferSizeInBytes</i>	the length of the buffer in bytes
--------------------------	-----------------------------------

#### 4.9.2.3 ~FTFont()

```
virtual FTFont::~~FTFont () [virtual]
```

### 4.9.3 Member Function Documentation

#### 4.9.3.1 Advance() [1/2]

```
virtual float FTFont::Advance (
    const char * string,
    const int len = -1,
    FTPoint spacing = FTPoint()) [virtual]
```

Get the advance for a string.

##### Parameters

<i>string</i>	'C' style string to be checked.
<i>len</i>	The length of the string. If < 0 then all characters will be checked until a null character is encountered (optional).
<i>spacing</i>	A displacement vector to add after each character has been checked (optional).

##### Returns

The string's advance width.

#### 4.9.3.2 Advance() [2/2]

```
virtual float FTFont::Advance (
    const wchar_t * string,
    const int len = -1,
    FTPoint spacing = FTPoint()) [virtual]
```

Get the advance for a string.

##### Parameters

<i>string</i>	A wchar_t string
<i>len</i>	The length of the string. If < 0 then all characters will be checked until a null character is encountered (optional).
<i>spacing</i>	A displacement vector to add after each character has been checked (optional).

##### Returns

The string's advance width.

#### 4.9.3.3 Ascender()

```
virtual float FTFont::Ascender () const [virtual]
```

Get the global ascender height for the face.

##### Returns

Ascender height

#### 4.9.3.4 Attach() [1/2]

```
virtual bool FTFont::Attach (
    const char * fontFilePath) [virtual]
```

Attach auxilliary file to font e.g font metrics.

Note: not all font formats implement this function.

##### Parameters

<i>fontFilePath</i>	auxilliary font file path.
---------------------	----------------------------

##### Returns

`true` if file has been attached successfully.

#### 4.9.3.5 Attach() [2/2]

```
virtual bool FTFont::Attach (
    const unsigned char * pBufferBytes,
    size_t bufferSizeInBytes) [virtual]
```

Attach auxilliary data to font e.g font metrics, from memory.

Note: not all font formats implement this function.

##### Parameters

<i>pBufferBytes</i>	the in-memory buffer.
<i>bufferSizeInBytes</i>	the length of the buffer in bytes.

##### Returns

`true` if file has been attached successfully.

#### 4.9.3.6 BBox() [1/4]

Generated by Doxygen

```
virtual FTBBox FTFont::BBox (
    const char * string,
    const int len = -1,
```

**Parameters**

<i>string</i>	A char buffer.
<i>len</i>	The length of the string. If < 0 then all characters will be checked until a null character is encountered (optional).
<i>position</i>	The pen position of the first character (optional).
<i>spacing</i>	A displacement vector to add after each character has been checked (optional).

**Returns**

The corresponding bounding box.

Referenced by [BBox\(\)](#), and [BBox\(\)](#).

**4.9.3.7 BBox() [2/4]**

```
void FTFont::BBox (
    const char * string,
    float & llx,
    float & lly,
    float & llz,
    float & urx,
    float & ury,
    float & urz) [inline]
```

Get the bounding box for a string (deprecated).

**Parameters**

<i>string</i>	A char buffer.
<i>llx</i>	Lower left near x coordinate.
<i>lly</i>	Lower left near y coordinate.
<i>llz</i>	Lower left near z coordinate.
<i>urx</i>	Upper right far x coordinate.
<i>ury</i>	Upper right far y coordinate.
<i>urz</i>	Upper right far z coordinate.

Definition at line 252 of file [FTFont.h](#).

References [BBox\(\)](#), [FTBBox::Lower\(\)](#), [FTBBox::Upper\(\)](#), [FTPoint::Xf\(\)](#), [FTPoint::Yf\(\)](#), and [FTPoint::Zf\(\)](#).

**4.9.3.8 BBox() [3/4]**

```
virtual FTBBox FTFont::BBox (
    const wchar_t * string,
    const int len = -1,
    FTPoint position = FTPoint(),
    FTPoint spacing = FTPoint()) [virtual]
```

Get the bounding box for a string.

**Parameters**

<i>string</i>	A <code>wchar_t</code> buffer.
<i>len</i>	The length of the string. If $< 0$ then all characters will be checked until a null character is encountered (optional).
<i>position</i>	The pen position of the first character (optional).
<i>spacing</i>	A displacement vector to add after each character has been checked (optional).

**Returns**

The corresponding bounding box.

**4.9.3.9 BBox() [4/4]**

```
void FTFont::BBox (
    const wchar_t * string,
    float & llx,
    float & lly,
    float & llz,
    float & urx,
    float & ury,
    float & urz) [inline]
```

Get the bounding box for a string (deprecated).

**Parameters**

<i>string</i>	A <code>wchar_t</code> buffer.
<i>llx</i>	Lower left near x coordinate.
<i>lly</i>	Lower left near y coordinate.
<i>llz</i>	Lower left near z coordinate.
<i>urx</i>	Upper right far x coordinate.
<i>ury</i>	Upper right far y coordinate.
<i>urz</i>	Upper right far z coordinate.

Definition at line 287 of file [FTFont.h](#).

References [BBox\(\)](#), [FTBBox::Lower\(\)](#), [FTBBox::Upper\(\)](#), [FTPoint::Xf\(\)](#), [FTPoint::Yf\(\)](#), and [FTPoint::Zf\(\)](#).

**4.9.3.10 CharMap()**

```
virtual bool FTFont::CharMap (
    FT_Encoding encoding) [virtual]
```

Set the character map for the face.

**Parameters**

<i>encoding</i>	Freetype enumerate for char map code.
-----------------	---------------------------------------

**Returns**

`true` if charmap was valid and set correctly.

**4.9.3.11 CharMapCount()**

```
virtual unsigned int FTFont::CharMapCount () const [virtual]
```

Get the number of character maps in this face.

**Returns**

character map count.

**4.9.3.12 CharMapList()**

```
virtual FT_Encoding * FTFont::CharMapList () [virtual]
```

Get a list of character maps in this face.

**Returns**

pointer to the first encoding.

**4.9.3.13 Depth()**

```
virtual void FTFont::Depth (  
    float depth) [virtual]
```

Set the extrusion distance for the font.

Only implemented by [FTExtrudeFont](#)

**Parameters**

<i>depth</i>	The extrusion distance.
--------------	-------------------------

**4.9.3.14 Descender()**

```
virtual float FTFont::Descender () const [virtual]
```

Gets the global descender height for the face.

**Returns**

Descender height

#### 4.9.3.15 Error()

```
virtual FT_Error FTFont::Error () const [virtual]
```

Queries the Font for errors.

##### Returns

The current error code.

#### 4.9.3.16 FaceSize() [1/2]

```
virtual unsigned int FTFont::FaceSize () const [virtual]
```

Get the current face size in points (1/72 inch).

##### Returns

face size

#### 4.9.3.17 FaceSize() [2/2]

```
virtual bool FTFont::FaceSize (
    const unsigned int size,
    const unsigned int res = 72) [virtual]
```

Set the char size for the current face.

##### Parameters

<i>size</i>	the face size in points (1/72 inch)
<i>res</i>	the resolution of the target device.

##### Returns

true if size was set correctly

#### 4.9.3.18 GlyphLoadFlags()

```
virtual void FTFont::GlyphLoadFlags (
    FT_Int flags) [virtual]
```

Set the glyph loading flags.

By default, fonts use the most sensible flags when loading a font's glyph using FT\_Load\_Glyph(). This function allows to override the default flags.

**Parameters**

<i>flags</i>	The glyph loading flags.
--------------	--------------------------

**4.9.3.19 LineHeight()**

```
virtual float FTFont::LineHeight () const [virtual]
```

Gets the line spacing for the font.

**Returns**

Line height

**4.9.3.20 MakeGlyph()**

```
virtual FTGlyph * FTFont::MakeGlyph (  
    FT_GlyphSlot slot) [protected], [pure virtual]
```

Construct a glyph of the correct type.

Clients must override the function and return their specialised [FTGlyph](#).

**Parameters**

<i>slot</i>	A FreeType glyph slot.
-------------	------------------------

**Returns**

An FT\*\*\*\*Glyph or `null` on failure.

Implemented in [FTBitmapFont](#), [FTBufferFont](#), [FTExtrudeFont](#), [FTOutlineFont](#), [FTPixmapFont](#), [FTPolygonFont](#), [FTTextureFont](#), and [FTTriangleExtractorFont](#).

References [FTFontImpl](#).

**4.9.3.21 Outset() [1/2]**

```
virtual void FTFont::Outset (  
    float front,  
    float back) [virtual]
```

Set the front and back outset distances for the font.

Only implemented by [FTExtrudeFont](#)

**Parameters**

<i>front</i>	The front outset distance.
<i>back</i>	The back outset distance.

**4.9.3.22 Outset() [2/2]**

```
virtual void FTFont::Outset (
    float outset) [virtual]
```

Set the outset distance for the font.

Only implemented by [FTOutlineFont](#), [FTPolygonFont](#) and [FTEXtrudeFont](#)

**Parameters**

<i>outset</i>	The outset distance.
---------------	----------------------

**4.9.3.23 Render() [1/2]**

```
virtual FTPoint FTFont::Render (
    const char * string,
    const int len = -1,
    FTPoint position = FTPoint(),
    FTPoint spacing = FTPoint(),
    int renderMode = FTGL::RENDER_ALL) [virtual]
```

Render a string of characters.

**Parameters**

<i>string</i>	'C' style string to be output.
<i>len</i>	The length of the string. If < 0 then all characters will be displayed until a null character is encountered (optional).
<i>position</i>	The pen position of the first character (optional).
<i>spacing</i>	A displacement vector to add after each character has been displayed (optional).
<i>renderMode</i>	Render mode to use for display (optional). Gives the application the ability to control whether to render the font's front and back faces via <a href="#">FTGL::RENDER_FRONT</a> and <a href="#">FTGL::RENDER_BACK</a> respectively, or font sides via <a href="#">FTGL::RENDER_SIDE</a> for extruded glyph fonts.

**Returns**

The new pen position after the last character was output.

References [FTGL::RENDER\\_ALL](#).

#### 4.9.3.24 Render() [2/2]

```
virtual FTPoint FTFont::Render (
    const wchar_t * string,
    const int len = -1,
    FTPoint position = FTPoint(),
    FTPoint spacing = FTPoint(),
    int renderMode = FTGL::RENDER_ALL) [virtual]
```

Render a string of characters.

##### Parameters

<i>string</i>	wchar_t string to be output.
<i>len</i>	The length of the string. If < 0 then all characters will be displayed until a null character is encountered (optional).
<i>position</i>	The pen position of the first character (optional).
<i>spacing</i>	A displacement vector to add after each character has been displayed (optional).
<i>renderMode</i>	Render mode to use for display (optional). Gives the application the ability to control whether to render the font's front and back faces via <a href="#">FTGL::RENDER_FRONT</a> and <a href="#">FTGL::RENDER_BACK</a> respectively, or font sides via <a href="#">FTGL::RENDER_SIDE</a> for extruded glyph fonts.

##### Returns

The new pen position after the last character was output.

References [FTGL::RENDER\\_ALL](#).

#### 4.9.3.25 UseDisplayList()

```
virtual void FTFont::UseDisplayList (
    bool useList) [virtual]
```

Enable or disable the use of Display Lists inside [FTGL](#).

##### Parameters

<i>useList</i>	true turns ON display lists. false turns OFF display lists.
----------------	---

### 4.10.1 Detailed Description

[FTGlyph](#) is the base class for [FTGL](#) glyphs.

It provides the interface between FreeType glyphs and their OpenGL renderable counterparts. This is an abstract class and derived classes must implement the `Render` function.

```

Destructor.

**4.10.3 Member Function Documentation****4.10.3.1 Advance()**

```
virtual float FTGlyph::Advance () const [virtual]
```

Return the advance width for this glyph.

**Returns**

advance width.

**4.10.3.2 BBox()**

```
virtual const FTBBBox & FTGlyph::BBox () const [virtual]
```

Return the bounding box for this glyph.

**Returns**

bounding box.

**4.10.3.3 Error()**

```
virtual FT_Error FTGlyph::Error () const [virtual]
```

Queries for errors.

**Returns**

The current error code.

**4.10.3.4 Render()**

```
virtual const FTPoint & FTGlyph::Render (
```

**Parameters**

<i>pen</i>	The current pen position.
<i>renderMode</i>	Render mode to display

**Returns**

The advance distance for this glyph.

Implemented in [FTBitmapGlyph](#), [FTBufferGlyph](#), [FTEXtrudeGlyph](#), [FTOutlineGlyph](#), [FTPixmapGlyph](#), [FTPolygonGlyph](#), [FTTextureGlyph](#), and [FTTriangleExtractorGlyph](#).

*Queries the Layout for errors.*

### Protected Member Functions

- [FTLayout](#) ()

### Friends

- class [FTSimpleLayout](#)

#### 4.11.1 Detailed Description

[FTLayout](#) is the interface for layout managers that render text.

Specific layout manager classes are derived from this class. This class is abstract and deriving classes must implement the protected `Render` methods to render formatted text and `BBox` methods to determine the bounding box of output text.

### 4.11.2.1 FTLayout()

`FTLayout::FTLayout () [protected]`

References [FTLayout\(\)](#).

Referenced by [FTLayout\(\)](#).

### 4.11.2.2 ~FTLayout()

`virtual FTLayout::~~FTLayout () [virtual]`

Destructor.

## 4.11.3 Member Function Documentation

### 4.11.3.1 BBox() [1/2]

```
virtual FTBBBox FTLayout::BBox (
    const char * string,
    const int len = -1,
    FTPoint position = FTPoint()) [pure virtual]
```

Get the bounding box for a formatted string.

#### Parameters

<i>string</i>	A char string.
<i>len</i>	The length of the string. If < 0 then all characters will be checked until a null character is encountered (optional).
<i>position</i>	The pen position of the first character (optional).

#### Returns

The corresponding bounding box.

Implemented in [FTSimpleLayout](#).

### 4.11.3.2 BBox() [2/2]

```
virtual FTBBBox FTLayout::BBox (
    const wchar_t * string,
    const int len = -1,
    FTPoint position = FTPoint()) [pure virtual]
```

Get the bounding box for a formatted string.

**Parameters**

<i>string</i>	A wchar_t string.
<i>len</i>	The length of the string. If < 0 then all characters will be checked until a null character is encountered (optional).
<i>position</i>	The pen position of the first character (optional).

**Returns**

The corresponding bounding box.

Implemented in [FTSimpleLayout](#).

**4.11.3.3 Error()**

```
virtual FT_Error FTLayout::Error () const [virtual]
```

Queries the Layout for errors.

**Returns**

The current error code.

**4.12 FTLibrary Class Reference**

[FTLibrary](#) class is the global accessor for the Freetype library.

```
#include <FTLibrary.h>
```

**Public Member Functions**

- const FT\_Library \* [GetLibrary](#) () const  
*Gets a pointer to the native Freetype library.*
- FT\_Error [Error](#) () const  
*Queries the library for errors.*
- [~FTLibrary](#) ()  
*Destructor.*
- void [LegacyOpenGLState](#) (bool On)  
*See README-LegacyOpenGLState.*
- bool [GetLegacyOpenGLStateSet](#) () const

## Static Public Member Functions

- static [FTLibrary](#) & [Instance](#) ()

*Global acces point to the single [FTLibrary](#) object.*

### 4.12.1 Detailed Description

[FTLibrary](#) class is the global accessor for the Freetype library.

This class encapsulates the Freetype Library. This is a singleton class and ensures that only one `FT_Library` is in existence at any one time. All constructors are private therefore clients cannot create or instantiate this class themselves and must access it's methods via the static `FTLibrary::Instance\(\)` function.

Just because this class returns a valid [FTLibrary](#) object doesn't mean that the Freetype Library has been successfully initialised. Clients should check for errors. You can initialise the library AND check for errors using the following code... `err = FTLibrary::Instance\(\).Error\(\) ;`

See also

"Freetype 2 Documentation"

Definition at line 56 of file [FTLibrary.h](#).

### 4.12.2 Constructor & Destructor Documentation

#### 4.12.2.1 ~FTLibrary()

```
FTLibrary::~FTLibrary ()
```

Destructor.

Disposes of the Freetype library

### 4.12.3 Member Function Documentation

#### 4.12.3.1 Error()

```
FT_Error FTLibrary::Error () const [inline]
```

Queries the library for errors.

Returns

The current error code.

Definition at line 78 of file [FTLibrary.h](#).

#### 4.12.3.2 GetLegacyOpenGLStateSet()

```
bool FTLibrary::GetLegacyOpenGLStateSet () const [inline]
```

Definition at line 97 of file [FTLibrary.h](#).

#### 4.12.3.3 GetLibrary()

```
const FT_Library * FTLibrary::GetLibrary () const [inline]
```

Gets a pointer to the native FreeType library.

##### Returns

A handle to a FreeType library instance.

Definition at line 71 of file [FTLibrary.h](#).

#### 4.12.3.4 Instance()

```
FTLibrary & FTLibrary::Instance () [static]
```

Global access point to the single [FTLibrary](#) object.

##### Returns

The global [FTLibrary](#) object.

#### 4.12.3.5 LegacyOpenGLState()

```
void FTLibrary::LegacyOpenGLState (  
    bool On)
```

See README-LegacyOpenGLState.

Choose incompatible legacy behaviour, see commit 29603ae3fa88c5b9e079a6db23be2cdea95aef39.

May only be set to the same value (but any number of times) within one program.

The documentation for this class was generated from the following file:

- [FTLibrary.h](#)

## 4.13 FTOutlineFont Class Reference

[FTOutlineFont](#) is a specialisation of the [FTFont](#) class for handling Vector Outline fonts.

```
#include <FTGLOutlineFont.h>
```

Inheritance diagram for FTOutlineFont:

### Public Member Functions

## 4.13.1 Detailed Description

[FTOutlineFont](#) is a specialisation of the [FTFont](#) class for handling Vector Outline fonts.

See also

[FTFont](#)

Definition at line 45 of file [FTGLOutlineFont.h](#).

## 4.13.2 Constructor & Destructor Documentation

### 4.13.2.1 FTOutlineFont() [1/2]

```
FTOutlineFont::FTOutlineFont (
    const char * fontFilePath)
```

Open and read a font file.

Sets Error flag.

#### Parameters

<i>fontFilePath</i>	font file path.
---------------------	-----------------

### 4.13.2.2 FTOutlineFont() [2/2]

```
FTOutlineFont::FTOutlineFont (
    const unsigned char * pBufferBytes,
    size_t bufferSizeInBytes)
```

Open and read a font from a buffer in memory.

Sets Error flag. The buffer is owned by the client and is NOT copied by [FTGL](#). The pointer must be valid while using [FTGL](#).

#### Parameters

<i>pBufferBytes</i>	the in-memory buffer
<i>bufferSizeInBytes</i>	the length of the buffer in bytes

### 4.13.2.3 ~FTOutlineFont()

```
FTOutlineFont::~FTOutlineFont ()
```

Destructor.

## 4.13.3 Member Function Documentation

### 4.13.3.1 MakeGlyph()

```
virtual FTGlyph * FTOutlineFont::MakeGlyph (
    FT_GlyphSlot slot) [protected], [virtual]
```

Construct a glyph of the correct type.

Clients must override the function and return their specialised [FTGlyph](#).

**Parameters**

<i>slot</i>	A FreeType glyph slot.
-------------	------------------------

**Returns**

An FT\*\*\*\*Glyph or `null` on failure.

Implements [FTFont](#).

The documentation for this class was generated from the following file:

- [FTGLOutlineFont.h](#)

## 4.14 FTOutlineGlyph Class Reference

[FTOutlineGlyph](#) is a specialisation of [FTGlyph](#) for creating outlines.

```
#include <FTOutlineGlyph.h>
```

Inheritance diagram for FTOutlineGlyph:

**Public Member Functions**

- [FTOutlineGlyph](#) (FT\_GlyphSlot glyph, float outset, bool useDisplayList)  
*Constructor.*
- virtual [~FTOutlineGlyph](#) ()  
*Destructor.*
- virtual const [FTPoint](#) & [Render](#) (const [FTPoint](#) &pen, int renderMode)  
*Render this glyph at the current pen position.*

**Public Member Functions inherited from [FTGlyph](#)**

*Destructor.*
- virtual float [Advance](#) () const  
*Return the advance width for this glyph.*
- virtual const [FTBBox](#) & [BBox](#) () const  
*Return the bounding box for this glyph.*
- virtual FT\_Error [Error](#) () const  
*Queries for errors.*

## Additional Inherited Members

## Protected Member Functions inherited from FTGlyph

- [FTGlyph](#) (FT\_GlyphSlot glyph)  
*Create a glyph.*

### 4.14.1 Detailed Description

[FTOutlineGlyph](#) is a specialisation of [FTGlyph](#) for creating outlines.

Definition at line 42 of file [FTOutlineGlyph.h](#).

### 4.14.2 Constructor & Destructor Documentation

#### 4.14.2.1 FTOutlineGlyph()

```
FTOutlineGlyph::FTOutlineGlyph (
    FT_GlyphSlot glyph,
    float outset,
    bool useDisplayList)
```

Constructor.

Sets the Error to Invalid\_Outline if the glyphs isn't an outline.

#### Parameters

<i>glyph</i>	The Freetype glyph to be processed
<i>outset</i>	outset distance
<i>useDisplayList</i>	Enable or disable the use of Display Lists for this glyph <code>true</code> turns ON display lists. <code>false</code> turns OFF display lists.

#### 4.14.2.2 ~FTOutlineGlyph()

```
virtual FTOutlineGlyph::~FTOutlineGlyph () [virtual]
```

Destructor.

### 4.14.3 Member Function Documentation

    int renderMode) [virtual]
```

Generated by Doxygen

Render this glyph at the current pen position.

**Parameters**

<i>pen</i>	The current pen position.
<i>renderMode</i>	Render mode to display

**Returns**

The advance distance for this glyph.

Implements [FTGlyph](#).

The documentation for this class was generated from the following file:

- [FTOutlineGlyph.h](#)

## 4.15 FTPixmapFont Class Reference

[FTPixmapFont](#) is a specialisation of the [FTFont](#) class for handling Pixmap (Grey Scale) fonts.

```
#include <FTGLPixmapFont.h>
```

### 4.15.1 Detailed Description

[FTPixmapFont](#) is a specialisation of the [FTFont](#) class for handling Pixmap (Grey Scale) fonts.

See also

[FTFont](#)

Definition at line 45 of file [FTGLPixmapFont.h](#).

### 4.15.2 Constructor & Destructor Documentation

#### 4.15.2.1 [FTPixmapFont\(\)](#) [1/2]

```
FTPixmapFont::FTPixmapFont (
    const char * fontFilePath)
```

Open and read a font file.

Sets Error flag.

#### Parameters

<i>fontFilePath</i>	font file path.
---------------------	-----------------

#### 4.15.2.2 [FTPixmapFont\(\)](#) [2/2]

```
FTPixmapFont::FTPixmapFont (
    const unsigned char * pBufferBytes,
    size_t bufferSizeInBytes)
```

Open and read a font from a buffer in memory.

Sets Error flag. The buffer is owned by the client and is NOT copied by [FTGL](#). The pointer must be valid while using [FTGL](#).

**Parameters**

<i>pBufferBytes</i>	the in-memory buffer
<i>bufferSizeInBytes</i>	the length of the buffer in bytes

**4.15.2.3 ~FTPixmapFont()**

```
FTPixmapFont::~~FTPixmapFont ()
```

Destructor.

**4.15.3 Member Function Documentation****4.15.3.1 MakeGlyph()**

```
virtual FTGlyph * FTPixmapFont::MakeGlyph (
    FT_GlyphSlot slot) [protected], [virtual]
```

Construct a glyph of the correct type.

Clients must override the function and return their specialised [FTGlyph](#).

**Parameters**

<i>slot</i>	A FreeType glyph slot.
-------------	------------------------

**Returns**

An FT\*\*\*\*Glyph or `null` on failure.

Implements [FTFont](#).

The documentation for this class was generated from the following file:

- [FTGLPixmapFont.h](#)

**4.16 FTPixmapGlyph Class Reference**

[FTPixmapGlyph](#) is a specialisation of [FTGlyph](#) for creating pixmaps.

```
#include <FTPixmapGlyph.h>
```

Inheritance diagram for FTPixmapGlyph:

*Create a glyph.*

### 4.16.1 Detailed Description

[FTPixmapGlyph](#) is a specialisation of [FTGlyph](#) for creating pixmaps.

Definition at line 42 of file [FTPixmapGlyph.h](#).

### 4.16.2 Constructor & Destructor Documentation

#### 4.16.2.1 FTPixmapGlyph()

```
FTPixmapGlyph::FTPixmapGlyph (
    FT_GlyphSlot glyph)
```

Constructor.

#### Parameters

<i>glyph</i>	The Freetype glyph to be processed
--------------	------------------------------------

#### 4.16.2.2 ~FTPixmapGlyph()

```
virtual FTPixmapGlyph::~~FTPixmapGlyph () [virtual]
```

Destructor.

### 4.16.3 Member Function Documentation

#### 4.16.3.1 Render()

```
virtual const FTPoint & FTPixmapGlyph::Render (  
    const FTPoint & pen,  
    int renderMode) [virtual]
```

Render this glyph at the current pen position.

##### Parameters

<i>pen</i>	The current pen position.
<i>renderMode</i>	Render mode to display

##### Returns

The advance distance for this glyph.

Implements [FTGlyph](#).

The documentation for this class was generated from the following file:

- [FTPixmapGlyph.h](#)

## 4.17 FTPoint Class Reference

### 4.17.1 Detailed Description

[FTPoint](#) class is a basic 3-dimensional point or vector.

Definition at line 42 of file [FTPoint.h](#).

## 4.17.2 Constructor & Destructor Documentation

### 4.17.2.1 FTPoint() [1/3]

```
FTPoint::FTPoint () [inline]
```

Default constructor.

Point is set to zero.

Definition at line 48 of file [FTPoint.h](#).

Referenced by [Normalise\(\)](#), [operator!=](#), [operator\\*\(\)](#), [operator\\*](#), [operator\\*](#), [operator+\(\)](#), [operator+=\(\)](#), [operator-\(\)](#), [operator-=\(\)](#), [operator==](#), and [operator^\(\)](#).

### 4.17.2.2 FTPoint() [2/3]

```
FTPoint::FTPoint (
    const FTGL_DOUBLE x,
    const FTGL_DOUBLE y,
    const FTGL_DOUBLE z = 0) [inline]
```

Constructor.

Z coordinate is set to zero if unspecified.

#### Parameters

<i>x</i>	First component
<i>y</i>	Second component
<i>z</i>	Third component

Definition at line 62 of file [FTPoint.h](#).

### 4.17.2.3 FTPoint() [3/3]

```
FTPoint::FTPoint (
    const FT_Vector & ft_vector) [inline]
```

Constructor.

This converts an FT\_Vector to an [FTPoint](#)

#### Parameters

<i>ft_vector</i>	A freetype vector
------------------	-------------------

Definition at line 75 of file [FTPoint.h](#).

### 4.17.3 Member Function Documentation

#### 4.17.3.1 Normalise()

```
FTPoint FTPoint::Normalise ()
```

Normalise a point's coordinates.

If the coordinates are zero, the point is left untouched.

##### Returns

A vector of norm one.

References [FTPoint\(\)](#).

#### 4.17.3.2 operator const FTGL\_DOUBLE \*()

```
FTPoint::operator const FTGL_DOUBLE * () const [inline]
```

Cast to FTGL\_DOUBLE\*.

Definition at line 240 of file [FTPoint.h](#).

#### 4.17.3.3 operator\*()

```
FTPoint FTPoint::operator* (
    double multiplier) const [inline]
```

Operator \* Scalar multiplication.

##### Parameters

<i>multiplier</i>	
-------------------	--

##### Returns

`this` multiplied by `multiplier`.

Definition at line 159 of file [FTPoint.h](#).

References [FTPoint\(\)](#).

#### 4.17.3.4 operator+()

```
FTPoint FTPoint::operator+ (
    const FTPoint & point) const [inline]
```

Operator +.

**Parameters**

<i>point</i>	
--------------	--

**Returns**

this plus point.

Definition at line 112 of file [FTPoint.h](#).

References [FTPoint\(\)](#).

**4.17.3.5 operator+=()**

```
FTPoint & FTPoint::operator+= (  
    const FTPoint & point) [inline]
```

Operator += In Place Addition.

**Parameters**

<i>point</i>	
--------------	--

**Returns**

this plus point.

Definition at line 97 of file [FTPoint.h](#).

References [FTPoint\(\)](#).

**4.17.3.6 operator-()**

```
FTPoint FTPoint::operator- (  
    const FTPoint & point) const [inline]
```

Operator -.

**Parameters**

<i>point</i>	
--------------	--

**Returns**

this minus point.

Definition at line 143 of file [FTPoint.h](#).

---

Generated by Doxygen  
References [FTPoint\(\)](#).

**4.17.3.7 operator-=()**

**Parameters**

<i>point</i>	
--------------	--

**Returns**

this minus point.

Definition at line 128 of file [FTPoint.h](#).

References [FTPoint\(\)](#).

**4.17.3.8 operator^()**

```
FTPoint FTPoint::operator^ (
    const FTPoint & point) [inline]
```

Operator ^ Vector product.

**Parameters**

<i>point</i>	Second point
--------------	--------------

**Returns**

this vector point.

Definition at line 204 of file [FTPoint.h](#).

References [FTPoint\(\)](#).

**4.17.3.9 X() [1/2]**

```
FTGL_DOUBLE FTPoint::X () const [inline]
```

Getters.

Definition at line 257 of file [FTPoint.h](#).

**4.17.3.10 X() [2/2]**

```
void FTPoint::X (
    FTGL_DOUBLE x) [inline]
```

Setters.

Definition at line 249 of file [FTPoint.h](#).

Referenced by [FTBBox::operator|=\(.\)](#).

#### 4.17.3.11 Xf()

```
FTGL_FLOAT FTPoint::Xf () const [inline]
```

Definition at line 260 of file [FTPoint.h](#).

Referenced by [FTFont::BBox\(\)](#), and [FTFont::BBox\(\)](#).

#### 4.17.3.12 Y() [1/2]

```
FTGL_DOUBLE FTPoint::Y () const [inline]
```

Definition at line 258 of file [FTPoint.h](#).

#### 4.17.3.13 Y() [2/2]

```
void FTPoint::Y (  
    FTGL_DOUBLE y) [inline]
```

Definition at line 250 of file [FTPoint.h](#).

Referenced by [FTBBox::operator|=\(\(\)\)](#).

#### 4.17.3.14 Yf()

```
FTGL_FLOAT FTPoint::Yf () const [inline]
```

Definition at line 261 of file [FTPoint.h](#).

Referenced by [FTFont::BBox\(\)](#), and [FTFont::BBox\(\)](#).

#### 4.17.3.15 Z() [1/2]

```
FTGL_DOUBLE FTPoint::Z () const [inline]
```

Definition at line 259 of file [FTPoint.h](#).

#### 4.17.3.16 Z() [2/2]

```
void FTPoint::Z (  
    FTGL_DOUBLE z) [inline]
```

Definition at line 251 of file [FTPoint.h](#).

Referenced by [FTBBox::operator|=\(\(\)\)](#).

#### 4.17.3.17 Zf()

---

Generated by Doxygen

```
FTGL_FLOAT FTPoint::Zf () const [inline]
```

Definition at line 262 of file [FTPoint.h](#).

**Parameters**

<i>a</i>	
<i>b</i>	

**Returns**

true if *a* & *b* are not equal

References [FTPoint\(\)](#).

**4.17.4.2 operator\* [1/2]**

```
FTPoint operator* (
    double multiplier,
    FTPoint & point) [friend]
```

Operator \* Scalar multiplication.

**Parameters**

<i>point</i>	
<i>multiplier</i>	

**Returns**

*multiplier* multiplied by *point*.

Definition at line 177 of file [FTPoint.h](#).

References [FTPoint\(\)](#).

**4.17.4.3 operator\* [2/2]**

```
double operator* (
    FTPoint & a,
    FTPoint & b) [friend]
```

Operator \* Scalar product.

**Parameters**

<i>a</i>	First vector.
<i>b</i>	Second vector.

**Returns**

*a* . *b* scalar product.

Definition at line 190 of file [FTPoint.h](#).

References [FTPoint\(\)](#).

## 4.17.4.4 operator==

```
bool operator== (
    const FTPoint & a,
    const FTPoint & b) [friend]
```

Operator == Tests for equality.

## Parameters

<i>a</i>	
<i>b</i>	

## Returns

true if a & b are equal

References [FTPoint\(\)](#).

## 4.20.2 Constructor & Destructor Documentation

### 4.20.2.1 FTSimpleLayout()

```
FTSimpleLayout::FTSimpleLayout ()
```

Initializes line spacing to 1.0, alignment to ALIGN\_LEFT and wrap to 100.0.

### 4.20.2.2 ~FTSimpleLayout()

```
FTSimpleLayout::~~FTSimpleLayout ()
```

Destructor.

## 4.20.3 Member Function Documentation

### 4.20.3.1 BBox() [1/2]

```
virtual FTBBBox FTSimpleLayout::BBox (
    const char * string,
    const int len = -1,
    FTPoint position = FTPoint()) [virtual]
```

Get the bounding box for a formatted string.

#### Parameters

<i>string</i>	A char string.
<i>len</i>	The length of the string. If < 0 then all characters will be checked until a null character is encountered (optional).
<i>position</i>	The pen position of the first character (optional).

#### Returns

The corresponding bounding box.

Implements [FTLayout](#).

### 4.20.3.2 BBox() [2/2]

```
virtual FTBBBox FTSimpleLayout::BBox (
    const wchar_t * string,
    const int len = -1,
    FTPoint position = FTPoint()) [virtual]
```

Get the bounding box for a formatted string.

**Parameters**

<i>string</i>	A wchar_t string.
<i>len</i>	The length of the string. If < 0 then all characters will be checked until a null character is encountered (optional).
<i>position</i>	The pen position of the first character (optional).

**Returns**

The corresponding bounding box.

Implements [FTLayout](#).

**4.20.3.3 GetAlignment()**

```
FTGL::TextAlignment FTSimpleLayout::GetAlignment () const
```

**Returns**

The text alignment mode.

**4.20.3.4 GetFont()**

```
FTFont * FTSimpleLayout::GetFont ()
```

**Returns**

The current font.

**4.20.3.5 GetLineLength()**

```
float FTSimpleLayout::GetLineLength () const
```

**Returns**

The current line length.

**4.20.3.6 GetLineSpacing()**

```
float FTSimpleLayout::GetLineSpacing () const
```

**Returns**

The line spacing.

**Parameters**

<i>string</i>	'C' style string to be output.
<i>len</i>	The length of the string. If < 0 then all characters will be displayed until a null character is encountered (optional).
<i>position</i>	The pen position of the first character (optional).
<i>renderMode</i>	Render mode to display (optional)

Implements [FTLayout](#).

References [FTGL::RENDER\\_ALL](#).

**4.20.3.8 Render() [2/2]**

```
virtual void FTSimpleLayout::Render (
    const wchar_t * string,
    const int len = -1,
    FTPoint position = FTPoint(),
    int renderMode = FTGL::RENDER_ALL) [virtual]
```

Render a string of characters.

**Parameters**

<i>string</i>	wchar_t string to be output.
<i>len</i>	The length of the string. If < 0 then all characters will be displayed until a null character is encountered (optional).
<i>position</i>	The pen position of the first character (optional).
<i>renderMode</i>	Render mode to display (optional)

Implements [FTLayout](#).

References [FTGL::RENDER\\_ALL](#).

**4.20.3.9 SetAlignment()**

```
void FTSimpleLayout::SetAlignment (
    const FTGL::TextAlignment Alignment)
```

The text alignment mode used to distribute space within a line or rendered text.

**Parameters**

<i>Alignment</i>	The new alignment mode.
------------------	-------------------------

**4.20.3.10 SetFont()**

```
void FTSimpleLayout::SetFont (
    FTFont * fontInit)
```

Set the font to use for rendering the text.

**Parameters**

<i>fontInit</i>	A pointer to the new font. The font is referenced by this but will not be disposed of when this is deleted.
-----------------	---

**4.20.3.11 SetLineLength()**

```
void FTSimpleLayout::SetLineLength (
    const float LineLength)
```

The maximum line length for formatting text.

**Parameters**

<i>LineLength</i>	The new line length.
-------------------	----------------------

**4.20.3.12 SetLineSpacing()**

```
void FTSimpleLayout::SetLineSpacing (
    const float LineSpacing)
```

Sets the line height.

**Parameters**

<i>LineSpacing</i>	The height of each line of text expressed as a percentage of the current fonts line height.
--------------------	---

The documentation for this class was generated from the following file:

- [FTSimpleLayout.h](#)

**4.21 FTTextureFont Class Reference**

[FTTextureFont](#) is a specialisation of the [FTFont](#) class for handling Texture mapped fonts.

```
#include <FTGLTextureFont.h>
```

#### 4.21.1 Detailed Description

[FTTextureFont](#) is a specialisation of the [FTFont](#) class for handling Texture mapped fonts.

See also

[FTFont](#)

Definition at line 45 of file [FTGLTextureFont.h](#).

#### 4.21.2 Constructor & Destructor Documentation

##### 4.21.2.1 FTTextureFont() [1/2]

```
FTTextureFont::FTTextureFont (
    const char * fontFilePath)
```

Open and read a font file.

Sets Error flag.

**Parameters**

<i>fontFilePath</i>	font file path.
---------------------	-----------------

**4.21.2.2 FTTextureFont() [2/2]**

```
FTTextureFont::FTTextureFont (
    const unsigned char * pBufferBytes,
    size_t bufferSizeInBytes)
```

Open and read a font from a buffer in memory.

Sets Error flag. The buffer is owned by the client and is NOT copied by [FTGL](#). The pointer must be valid while using [FTGL](#).

**Parameters**

<i>pBufferBytes</i>	the in-memory buffer
<i>bufferSizeInBytes</i>	the length of the buffer in bytes

**4.21.2.3 ~FTTextureFont()**

```
virtual FTTextureFont::~~FTTextureFont () [virtual]
```

Destructor.

**4.21.3 Member Function Documentation****4.21.3.1 MakeGlyph()**

```
virtual FTGlyph * FTTextureFont::MakeGlyph (
    FT_GlyphSlot slot) [protected], [virtual]
```

Construct a glyph of the correct type.

Clients must override the function and return their specialised [FTGlyph](#).

**Parameters**

<i>slot</i>	A FreeType glyph slot.
-------------	------------------------

**Returns**

An FT\*\*\*\*Glyph or `null` on failure.

Implements [FTFont](#).

The documentation for this class was generated from the following file:

- [FTGLTextureFont.h](#)

## 4.22 FTTextureGlyph Class Reference

[FTTextureGlyph](#) is a specialisation of [FTGlyph](#) for creating texture glyphs.

```
#include <FTTextureGlyph.h>
```

Inheritance diagram for FTTextureGlyph:

- virtual FT\_Error [Error](#) () const  
*Queries for errors.*

### Additional Inherited Members

### Protected Member Functions inherited from [FTGlyph](#)

- [FTGlyph](#) (FT\_GlyphSlot glyph)  
*Create a glyph.*

#### 4.22.1 Detailed Description

[FTTextureGlyph](#) is a specialisation of [FTGlyph](#) for creating texture glyphs.

Definition at line 43 of file [FTTextureGlyph.h](#).

## 4.22.2 Constructor & Destructor Documentation

### 4.22.2.1 FTTextureGlyph()

```
FTTextureGlyph::FTTextureGlyph (
    FT_GlyphSlot glyph,
    int id,
    int xOffset,
    int yOffset,
    int width,
    int height)
```

Constructor.

#### Parameters

<i>glyph</i>	The Freetype glyph to be processed
<i>id</i>	The id of the texture that this glyph will be drawn in
<i>xOffset</i>	The x offset into the parent texture to draw this glyph
<i>yOffset</i>	The y offset into the parent texture to draw this glyph
<i>width</i>	The width of the parent texture
<i>height</i>	The height (number of rows) of the parent texture

### 4.22.2.2 ~FTTextureGlyph()

```
virtual FTTextureGlyph::~FTTextureGlyph () [virtual]
```

Destructor.

## 4.22.3 Member Function Documentation

### 4.22.3.1 Render()

```
virtual const FTPoint & FTTextureGlyph::Render (
    const FTPoint & pen,
    int renderMode) [virtual]
```

Render this glyph at the current pen position.

#### Parameters

<i>pen</i>	The current pen position.
<i>renderMode</i>	Render mode to display

#### Returns

The advance distance for this glyph.

Implements [FTGlyph](#).

The documentation for this class was generated from the following file:

- [FTTextureGlyph.h](#)

## 4.23 FTTriangleExtractorFont Class Reference

[FTPolygonFont](#) is a specialisation of the [FTFont](#) class for handling tessellated Polygon Mesh fonts.

```
#include <FTGLTriangleExtractorFont.h>
```

Inheritance diagram for FTTriangleExtractorFont:

### Public Member Functions

- [FTTriangleExtractorFont](#) (const char \*fontFilePath, std::vector< float > &triangles)

*Open and read a font from a buffer in memory.*

#### 4.23.1 Detailed Description

**FTPolygonFont** is a specialisation of the **FTFont** class for handling tessellated Polygon Mesh fonts.

See also

[FTFont](#)

Definition at line 44 of file [FTGLTriangleExtractorFont.h](#).

## 4.23.2 Constructor & Destructor Documentation

### 4.23.2.1 FTTriangleExtractorFont() [1/2]

```
FTTriangleExtractorFont::FTTriangleExtractorFont (
    const char * fontFilePath,
    std::vector< float > & triangles)
```

Open and read a font file.

Sets Error flag.

#### Parameters

<i>fontFilePath</i>	font file path.
<i>triangles</i>	the container to store the triangle data.

### 4.23.2.2 FTTriangleExtractorFont() [2/2]

```
FTTriangleExtractorFont::FTTriangleExtractorFont (
    const unsigned char * pBufferBytes,
    size_t bufferSizeInBytes,
    std::vector< float > & triangles)
```

Open and read a font from a buffer in memory.

Sets Error flag. The buffer is owned by the client and is NOT copied by [FTGL](#). The pointer must be valid while using [FTGL](#).

#### Parameters

<i>pBufferBytes</i>	the in-memory buffer
<i>bufferSizeInBytes</i>	the length of the buffer in bytes
<i>triangles</i>	the container to store the triangle data.

### 4.23.2.3 ~FTTriangleExtractorFont()

```
FTTriangleExtractorFont::~FTTriangleExtractorFont ()
```

Destructor.

## 4.23.3 Member Function Documentation

### 4.23.3.1 MakeGlyph()

```
virtual FTGlyph * FTTriangleExtractorFont::MakeGlyph (
    FT_GlyphSlot slot) [protected], [virtual]
```

---

Generated by Doxygen  
Construct a glyph of the correct type.

Clients must override the function and return their specialised [FTGlyph](#).

**Parameters**

<i>slot</i>	A FreeType glyph slot.
-------------	------------------------

**Returns**

An FT\*\*\*\*Glyph or `null` on failure.

Implements [FTFont](#).

The documentation for this class was generated from the following file:

- [FTGLTriangleExtractorFont.h](#)

## 4.24 FTTriangleExtractorGlyph Class Reference

[FTPolygonGlyph](#) is a specialisation of [FTGlyph](#) for creating tessellated polygon glyphs.

```
#include <FTTriangleExtractorGlyph.h>
```

### 4.24.1 Detailed Description

[FTPolygonGlyph](#) is a specialisation of [FTGlyph](#) for creating tessellated polygon glyphs.

Definition at line 42 of file [FTTriangleExtractorGlyph.h](#).

## 4.24.2 Constructor & Destructor Documentation

### 4.24.2.1 FTTriangleExtractorGlyph()

```
FTTriangleExtractorGlyph::FTTriangleExtractorGlyph (
    FT_GlyphSlot glyph,
    float outset,
    std::vector< float > & triangles)
```

Constructor.

Sets the Error to Invalid\_Outline if the glyphs isn't an outline.

#### Parameters

<i>glyph</i>	The Freetype glyph to be processed
<i>outset</i>	The outset distance
<i>useDisplayList</i>	Enable or disable the use of Display Lists for this glyph <code>true</code> turns ON display lists. <code>false</code> turns OFF display lists.

### 4.24.2.2 ~FTTriangleExtractorGlyph()

```
virtual FTTriangleExtractorGlyph::~FTTriangleExtractorGlyph () [virtual]
```

Destructor.

## 4.24.3 Member Function Documentation

### 4.24.3.1 Render()

```
virtual const FTPoint & FTTriangleExtractorGlyph::Render (
    const FTPoint & pen,
    int renderMode) [virtual]
```

Generated by Doxygen

Render this glyph at the current pen position.

**Parameters**

<i>pen</i>	The current pen position.
<i>renderMode</i>	Render mode to display

**Returns**

The advance distance for this glyph.

Implements [FTGlyph](#).

## Data Structures

- class [FTExtrudeGlyph](#)  
*FTExtrudeGlyph is a specialisation of FTGlyph for creating tessellated extruded polygon glyphs.*

## Macros

- `#define FTExtrdGlyph FTExtrudeGlyph`

## Functions

- [FTGLglyph](#) \* [ftglCreateExtrudeGlyph](#) (FT\_GlyphSlot glyph, float depth, float frontOutset, float backOutset, int useDisplayList)  
*Create a specialisation of FTGLglyph for creating tessellated extruded polygon glyphs.*

## 5.15.1 Macro Definition Documentation

### 5.15.1.1 FTExtrdGlyph

```
#define FTExtrdGlyph FTExtrudeGlyph
```

Definition at line 77 of file [FTExtrdGlyph.h](#).

## 5.15.2 Function Documentation

### 5.15.2.1 ftglCreateExtrudeGlyph()

```
FTGLglyph * ftglCreateExtrudeGlyph (
    FT_GlyphSlot glyph,
    float depth,
    float frontOutset,
    float backOutset,
    int useDisplayList)
```

Create a specialisation of [FTGLglyph](#) for creating tessellated extruded polygon glyphs.

## Parameters

<i>glyph</i>	The Freetype glyph to be processed
<i>depth</i>	The distance along the z axis to extrude the glyph
<i>frontOutset</i>	outset contour size
<i>backOutset</i>	outset contour size
<i>useDisplayList</i>	Enable or disable the use of Display Lists for this glyph <code>true</code> turns ON display lists. <code>false</code> turns OFF display lists.

## Returns

An FTGLglyph\* object.

### Data Structures

- class [FTFont](#)

*FTFont is the public interface for the [FTGL](#) library.*

## Typedefs

- typedef struct \_FTGLfont [FTGLfont](#)

## Functions

- [FTGLfont](#) \* [ftglCreateCustomFont](#) (char const \*fontFilePath, void \*data, [FTGLglyph](#) \*(\*makeglyph↵  
Callback)(FT\_GlyphSlot, void \*))  
*Create a custom [FTGL](#) font object.*
- [FTGLfont](#) \* [ftglCreateCustomFontFromMem](#) (const unsigned char \*bytes, size\_t len, void \*data, [FTGLglyph](#)  
\*(\*makeglyphCallback)(FT\_GlyphSlot, void \*))  
*Create a custom [FTGL](#) font object from a buffer in memory.*
- void [ftglDestroyFont](#) ([FTGLfont](#) \*font)  
*Destroy an [FTGL](#) font object.*
- int [ftglAttachFile](#) ([FTGLfont](#) \*font, const char \*path)  
*Attach auxilliary file to font e.g.*
- int [ftglAttachData](#) ([FTGLfont](#) \*font, const unsigned char \*data, size\_t size)  
*Attach auxilliary data to font, e.g.*
- void [ftglSetFontGlyphLoadFlags](#) ([FTGLfont](#) \*font, FT\_Int flags)  
*Set the glyph loading flags.*
- int [ftglSetFontCharMap](#) ([FTGLfont](#) \*font, FT\_Encoding encoding)  
*Set the character map for the face.*
- unsigned int [ftglGetFontCharMapCount](#) ([FTGLfont](#) \*font)  
*Get the number of character maps in this face.*
- FT\_Encoding \* [ftglGetFontCharMapList](#) ([FTGLfont](#) \*font)  
*Get a list of character maps in this face.*
- int [ftglSetFontFaceSize](#) ([FTGLfont](#) \*font, unsigned int size, unsigned int res)  
*Set the char size for the current face.*
- unsigned int [ftglGetFontFaceSize](#) ([FTGLfont](#) \*font)  
*Get the current face size in points (1/72 inch).*
- void [ftglSetFontDepth](#) ([FTGLfont](#) \*font, float depth)  
*Set the extrusion distance for the font.*
- void [ftglSetFontOutset](#) ([FTGLfont](#) \*font, float front, float back)  
*Set the outset distance for the font.*
- void [ftglSetFontDisplayList](#) ([FTGLfont](#) \*font, int useList)  
*Enable or disable the use of Display Lists inside [FTGL](#).*
- float [ftglGetFontAscender](#) ([FTGLfont](#) \*font)  
*Get the global ascender height for the face.*
- float [ftglGetFontDescender](#) ([FTGLfont](#) \*font)  
*Gets the global descender height for the face.*
- float [ftglGetFontLineHeight](#) ([FTGLfont](#) \*font)  
*Gets the line spacing for the font.*
- void [ftglGetFontBBox](#) ([FTGLfont](#) \*font, const char \*string, int len, float bounds[6])  
*Get the bounding box for a string.*
- float [ftglGetFontAdvance](#) ([FTGLfont](#) \*font, const char \*string)  
*Get the advance width for a string.*
- void [ftglRenderFont](#) ([FTGLfont](#) \*font, const char \*string, int mode)  
*Render a string of characters.*
- FT\_Error [ftglGetFontError](#) ([FTGLfont](#) \*font)  
*Query a font for errors.*

## 5.17.1 Typedef Documentation

### 5.17.1.1 FTGLfont

```
typedef struct _FTGLfont FTGLfont
```

Definition at line 414 of file [FTFont.h](#).

## 5.17.2 Function Documentation

### 5.17.2.1 ftglAttachData()

```
int ftglAttachData (
    FTGLfont * font,
    const unsigned char * data,
    size_t size)
```

Attach auxilliary data to font, e.g.

font metrics, from memory.

Note: not all font formats implement this function.

#### Parameters

<i>font</i>	An FTGLfont* object.
<i>data</i>	The in-memory buffer.
<i>size</i>	The length of the buffer in bytes.

#### Returns

1 if file has been attached successfully.

References [FTGL\\_EXPORT](#).

### 5.17.2.2 ftglAttachFile()

```
int ftglAttachFile (
    FTGLfont * font,
    const char * path)
```

Attach auxilliary file to font e.g.

font metrics.

Note: not all font formats implement this function.

**Parameters**

<i>font</i>	An FTGLfont* object.
<i>path</i>	Auxilliary font file path.

**Returns**

1 if file has been attached successfully.

References [FTGL\\_EXPORT](#).

**5.17.2.3 ftglCreateCustomFont()**

```
FTGLfont * ftglCreateCustomFont (
    char const * fontFilePath,
    void * data,
    FTGLglyph *(* makeglyphCallback ) (FT_GlyphSlot, void *))
```

Create a custom [FTGL](#) font object.

**Parameters**

<i>fontFilePath</i>	The font file name.
<i>data</i>	A pointer to private data that will be passed to callbacks.
<i>makeglyphCallback</i>	A glyph-making callback function.

**Returns**

An FTGLfont\* object.

References [FTGL\\_EXPORT](#).

**5.17.2.4 ftglCreateCustomFontFromMem()**

```
FTGLfont * ftglCreateCustomFontFromMem (
    const unsigned char * bytes,
    size_t len,
    void * data,
    FTGLglyph *(* makeglyphCallback ) (FT_GlyphSlot, void *))
```

Create a custom [FTGL](#) font object from a buffer in memory.

**Parameters**

<i>bytes</i>	the in-memory buffer
<i>len</i>	the length of the buffer in bytes
<i>data</i>	A pointer to private data that will be passed to callbacks.

<i>makeglyphCallback</i>	A glyph-making callback function.
--------------------------	-----------------------------------

**Returns**

An FTGLfont\* object.

References [FTGL\\_EXPORT](#).

**5.17.2.5 ftglDestroyFont()**

```
void ftglDestroyFont (  
    FTGLfont * font)
```

Destroy an [FTGL](#) font object.

**Parameters**

<i>font</i>	An FTGLfont* object.
-------------	----------------------

References [FTGL\\_EXPORT](#).

**5.17.2.6 ftglGetFontAdvance()**

```
float ftglGetFontAdvance (  
    FTGLfont * font,  
    const char * string)
```

Get the advance width for a string.

**Parameters**

<i>font</i>	An FTGLfont* object.
<i>string</i>	A char string.

**Returns**

Advance width

References [FTGL\\_EXPORT](#).

**5.17.2.7 ftglGetFontAscender()**

```
float ftglGetFontAscender (  
    FTGLfont * font)
```

Get the global ascender height for the face.

**Parameters**

<i>font</i>	An FTGLfont* object.
-------------	----------------------

**Returns**

Ascender height

References [FTGL\\_EXPORT](#).

**5.17.2.8 ftglGetFontBBox()**

```
void ftglGetFontBBox (
    FTGLfont * font,
    const char * string,
    int len,
    float bounds[6])
```

Get the bounding box for a string.

**Parameters**

<i>font</i>	An FTGLfont* object.
<i>string</i>	A char buffer
<i>len</i>	The length of the string. If < 0 then all characters will be checked until a null character is encountered (optional).
<i>bounds</i>	An array of 6 float values where the bounding box's lower left near and upper right far 3D coordinates will be stored.

References [FTGL\\_EXPORT](#).

**5.17.2.9 ftglGetFontCharMapCount()**

```
unsigned int ftglGetFontCharMapCount (
    FTGLfont * font)
```

Get the number of character maps in this face.

**Parameters**

<i>font</i>	An FTGLfont* object.
-------------	----------------------

**Returns**

character map count.

References [FTGL\\_EXPORT](#).

**Parameters**

<i>font</i>	An FTGLfont* object.
-------------	----------------------

**Returns**

pointer to the first encoding.

References [FTGL\\_EXPORT](#).

**5.17.2.11 ftglGetFontDescender()**

```
float ftglGetFontDescender (  
    FTGLfont * font)
```

Gets the global descender height for the face.

**Parameters**

<i>font</i>	An FTGLfont* object.
-------------	----------------------

**Returns**

Descender height

References [FTGL\\_EXPORT](#).

**5.17.2.12 ftglGetFontError()**

```
FT_Error ftglGetFontError (  
    FTGLfont * font)
```

Query a font for errors.

**Parameters**

<i>font</i>	An FTGLfont* object.
-------------	----------------------

**Returns**

The current error code.

References [FTGL\\_END\\_C\\_DECLS](#), and [FTGL\\_EXPORT](#).

**5.17.2.13 ftglGetFontFaceSize()**

```
unsigned int ftglGetFontFaceSize (  
    FTGLfont * font)
```

Get the current face size in points (1/72 inch).

**Parameters**

<i>font</i>	An FTGLfont* object.
-------------	----------------------

**Returns**

face size

References [FTGL\\_EXPORT](#).

**5.17.2.14 ftglGetFontLineHeight()**

```
float ftglGetFontLineHeight (  
    FTGLFont * font)
```

Gets the line spacing for the font.

**Parameters**

<i>font</i>	An FTGLfont* object.
-------------	----------------------

**Returns**

Line height

References [FTGL\\_EXPORT](#).

**5.17.2.15 ftglRenderFont()**

```
void ftglRenderFont (  
    FTGLFont * font,  
    const char * string,  
    int mode)
```

Render a string of characters.

**Parameters**

<i>font</i>	An FTGLfont* object.
<i>string</i>	Char string to be output.
<i>mode</i>	Render mode to display.

References [FTGL\\_EXPORT](#).

**5.17.2.16 ftglSetFontCharMap()**

```
int ftglSetFontCharMap (  
    FTGLFont * font,  
    FT_Encoding encoding)
```

Set the character map for the face.

**Parameters**

<i>font</i>	An FTGLfont* object.
<i>encoding</i>	Freetype enumerate for char map code.

**Returns**

1 if charmap was valid and set correctly.

References [FTGL\\_EXPORT](#).

**5.17.2.17 ftglSetFontDepth()**

```
void ftglSetFontDepth (
    FTGLfont * font,
    float depth)
```

Set the extrusion distance for the font.

Only implemented by [FTEXtrudeFont](#).

**Parameters**

<i>font</i>	An FTGLfont* object.
<i>depth</i>	The extrusion distance.

References [FTGL\\_EXPORT](#).

**5.17.2.18 ftglSetFontDisplayList()**

```
void ftglSetFontDisplayList (
    FTGLfont * font,
    int useList)
```

Enable or disable the use of Display Lists inside [FTGL](#).

**Parameters**

<i>font</i>	An FTGLfont* object.
<i>useList</i>	1 turns ON display lists. 0 turns OFF display lists.

References [FTGL\\_EXPORT](#).

**5.17.2.19 ftglSetFontFaceSize()**

```
int ftglSetFontFaceSize (
    FTGLfont * font,
    unsigned int size,
    unsigned int res)
```

Set the char size for the current face.

**Parameters**

<i>font</i>	An FTGLfont* object.
<i>size</i>	The face size in points (1/72 inch).
<i>res</i>	The resolution of the target device, or 0 to use the default value of 72.

**Returns**

1 if size was set correctly.

References [FTGL\\_EXPORT](#).

**5.17.2.20 ftglSetFontGlyphLoadFlags()**

```
void ftglSetFontGlyphLoadFlags (
    FTGLfont * font,
    FT_Int flags)
```

Set the glyph loading flags.

By default, fonts use the most sensible flags when loading a font's glyph using FT\_Load\_Glyph(). This function allows to override the default flags.

**Parameters**

<i>font</i>	An FTGLfont* object.
<i>flags</i>	The glyph loading flags.

References [FTGL\\_EXPORT](#).

**5.17.2.21 ftglSetFontOutset()**

```
void ftglSetFontOutset (
    FTGLfont * font,
    float front,
    float back)
```

Set the outset distance for the font.

Only [FTOutlineFont](#), [FTPolygonFont](#) and [FTExtrudeFont](#) implement front outset. Only [FTExtrudeFont](#) implements back outset.

**Parameters**

<i>font</i>	An FTGLfont* object.
<i>front</i>	The front outset distance.
<i>back</i>	The back outset distance.

References [FTGL\\_EXPORT](#).

## 5.21 FTGLBitmapFont.h File Reference

```
#include <FTGL/ftgl.h>
```

### Data Structures

- class [FTBitmapFont](#)  
*FTBitmapFont* is a specialisation of the *FTFont* class for handling Bitmap fonts.

### Macros

- #define [FTGLBitmapFont](#) [FTBitmapFont](#)

### Functions

- [FTGLfont \\* ftglCreateBitmapFont](#) (const char \*file)  
Create a specialised *FTGLfont* object for handling bitmap fonts.
- [FTGLfont \\* ftglCreateBitmapFontFromMem](#) (const unsigned char \*bytes, size\_t len)  
Create a specialised *FTGLfont* object for handling bitmap fonts from a buffer in memory.

## 5.21.1 Macro Definition Documentation

### 5.21.1.1 FTGLBitmapFont

```
#define FTGLBitmapFont FTBitmapFont
```

Definition at line 84 of file [FTGLBitmapFont.h](#).

## 5.21.2 Function Documentation

### 5.21.2.1 ftglCreateBitmapFont()

```
FTGLfont * ftglCreateBitmapFont (  
    const char * file)
```

Create a specialised [FTGLfont](#) object for handling bitmap fonts.

#### Parameters

<i>file</i>	The font file name.
-------------	---------------------

#### Returns

An [FTGLfont\\*](#) object.

#### See also

[FTGLfont](#)

References [FTGL\\_EXPORT](#).

### 5.21.2.2 ftglCreateBitmapFontFromMem()

```
FTGLfont * ftglCreateBitmapFontFromMem (  
    const unsigned char * bytes,  
    size_t len)
```

Create a specialised [FTGLfont](#) object for handling bitmap fonts from a buffer in memory.

Sets Error flag. The buffer is owned by the client and is NOT copied by [FTGL](#). The pointer must be valid while using [FTGL](#).

#### Parameters

<i>bytes</i>	the in-memory buffer
<i>len</i>	the length of the buffer in bytes

#### Returns

An [FTGLfont\\*](#) object.

References [FTGL\\_END\\_C\\_DECLS](#), and [FTGL\\_EXPORT](#).

### Data Structures

- class [FTOutlineFont](#)  
*FTOutlineFont* is a specialisation of the *FTFont* class for handling Vector Outline fonts.

### Macros

- #define [FTGLOutlineFont](#) [FTOutlineFont](#)

### Functions

- [FTGLfont](#) \* [ftglCreateOutlineFont](#) (const char \*file)  
Create a specialised *FTGLfont* object for handling vector outline fonts.
- [FTGLfont](#) \* [ftglCreateOutlineFontFromMem](#) (const unsigned char \*bytes, size\_t len)  
Create a specialised *FTGLfont* object for handling vector outline fonts from a buffer in memory.

## 5.25.1 Macro Definition Documentation

### 5.25.1.1 FTGLOutlineFont

```
#define FTGLOutlineFont FTOutlineFont
```

Definition at line 84 of file [FTGLOutlineFont.h](#).

## 5.25.2 Function Documentation

### 5.25.2.1 ftglCreateOutlineFont()

```
FTGLfont * ftglCreateOutlineFont (
    const char * file)
```

Create a specialised *FTGLfont* object for handling vector outline fonts.

**Parameters**

<i>file</i>	The font file name.
-------------	---------------------

**Returns**

An FTGLfont\* object.

**See also**

[FTGLfont](#)

References [FTGL\\_EXPORT](#).

**5.25.2.2 ftglCreateOutlineFontFromMem()**

```
FTGLfont * ftglCreateOutlineFontFromMem (
    const unsigned char * bytes,
    size_t len)
```

Create a specialised [FTGLfont](#) object for handling vector outline fonts from a buffer in memory.

Sets Error flag. The buffer is owned by the client and is NOT copied by [FTGL](#). The pointer must be valid while using [FTGL](#).

**Parameters**

<i>bytes</i>	the in-memory buffer
<i>len</i>	the length of the buffer in bytes

**Returns**

An FTGLfont\* object.

References [FTGL\\_END\\_C\\_DECLS](#), and [FTGL\\_EXPORT](#).

```

### Data Structures

- class [FTTriangleExtractorFont](#)  
*FTPolygonFont* is a specialisation of the *FTFont* class for handling tessellated Polygon Mesh fonts.

### Macros

- #define [FTGLTriangleExtractorFont](#) [FTTriangleExtractorFont](#)

### Functions

- [FTGLfont \\* ftglCreateTriangleExtractorFont](#) (const char \*file)  
Create a specialised *FTGLfont* object for handling tessellated polygon mesh fonts.
- [FTGLfont \\* ftglCreateTriangleExtractorFontFromMem](#) (const unsigned char \*bytes, size\_t len)  
Create a specialised *FTGLfont* object for handling tessellated polygon mesh fonts from a buffer in memory.

## 5.33.1 Macro Definition Documentation

### 5.33.1.1 FTGLTriangleExtractorFont

```
#define FTGLTriangleExtractorFont FTTriangleExtractorFont
```

Definition at line 85 of file [FTGLTriangleExtractorFont.h](#).

## 5.33.2 Function Documentation

### 5.33.2.1 ftglCreateTriangleExtractorFont()

```
FTGLfont * ftglCreateTriangleExtractorFont (
    const char * file)
```

Create a specialised *FTGLfont* object for handling tessellated polygon mesh fonts.

**Parameters**

<i>file</i>	The font file name.
-------------	---------------------

**Returns**

An FTGLfont\* object.

**See also**

[FTGLfont](#)

References [FTGL\\_EXPORT](#).

**5.33.2.2 ftglCreateTriangleExtractorFontFromMem()**

```
FTGLfont * ftglCreateTriangleExtractorFontFromMem (
    const unsigned char * bytes,
    size_t len)
```

Create a specialised [FTGLfont](#) object for handling tessellated polygon mesh fonts from a buffer in memory.

Sets Error flag. The buffer is owned by the client and is NOT copied by [FTGL](#). The pointer must be valid while using [FTGL](#).

**Parameters**

<i>bytes</i>	the in-memory buffer
<i>len</i>	the length of the buffer in bytes

**Returns**

An FTGLfont\* object.

References [FTGL\\_END\\_C\\_DECLS](#), and [FTGL\\_EXPORT](#).

## 5.35 FTGlyph.h File Reference

```
#include <FTGL/ftgl.h>
```

### Data Structures

- class [FTGlyph](#)  
*FTGlyph is the base class for FTGL glyphs.*

### Typedefs

- typedef struct \_FTGLglyph [FTGLglyph](#)

## Functions

- `FTGLglyph * ftglCreateCustomGlyph (FTGLglyph *base, void *data, void(*renderCallback)(FTGLglyph *, void *, FTGL_DOUBLE, FTGL_DOUBLE, int, FTGL_DOUBLE *, FTGL_DOUBLE *), void(*destroyCallback)(FTGLglyph *, void *))`  
Create a custom *FTGL* glyph object.
- `void ftglDestroyGlyph (FTGLglyph *glyph)`  
Destroy an *FTGL* glyph object.
- `void ftglRenderGlyph (FTGLglyph *glyph, FTGL_DOUBLE penx, FTGL_DOUBLE peny, int renderMode, FTGL_DOUBLE *advancex, FTGL_DOUBLE *advancey)`  
Render a glyph at the current pen position and compute the corresponding advance.
- `float ftglGetGlyphAdvance (FTGLglyph *glyph)`  
Return the advance for a glyph.
- `void ftglGetGlyphBBox (FTGLglyph *glyph, float bounds[6])`  
Return the bounding box for a glyph.
- `FT_Error ftglGetGlyphError (FTGLglyph *glyph)`  
Query a glyph for errors.

## 5.35.1 Typedef Documentation

### 5.35.1.1 FTGLglyph

```
typedef struct _FTGLglyph FTGLglyph
```

Definition at line 134 of file [FTGlyph.h](#).

## 5.35.2 Function Documentation

### 5.35.2.1 ftglCreateCustomGlyph()

```
FTGLglyph * ftglCreateCustomGlyph (
    FTGLglyph * base,
    void * data,
    void(* renderCallback ) (FTGLglyph *, void *, FTGL_DOUBLE, FTGL_DOUBLE, int, FTGL_DOUBLE
*, FTGL_DOUBLE *),
    void(* destroyCallback ) (FTGLglyph *, void *))
```

Create a custom *FTGL* glyph object.

FIXME: maybe get rid of "base" and have advanceCallback etc. functions

#### Parameters

<i>base</i>	The base FTGLglyph* to subclass.
<i>data</i>	A pointer to private data that will be passed to callbacks.
<i>renderCallback</i>	A rendering callback function.
<i>destroyCallback</i>	A callback function to be called upon destruction.

#### Returns

An FTGLglyph\* object.

References [FTGL\\_EXPORT](#).

### 5.35.2.2 ftglDestroyGlyph()

```
void ftglDestroyGlyph (
    FTGLglyph * glyph)
```

Destroy an [FTGL](#) glyph object.

#### Parameters

<i>glyph</i>	An FTGLglyph* object.
--------------	-----------------------

References [FTGL\\_EXPORT](#).

### 5.35.2.3 ftglGetGlyphAdvance()

```
float ftglGetGlyphAdvance (
    FTGLglyph * glyph)
```

Return the advance for a glyph.

#### Parameters

<i>glyph</i>	An FTGLglyph* object.
--------------	-----------------------

#### Returns

The advance's X component.

References [FTGL\\_EXPORT](#).

### 5.35.2.4 ftglGetGlyphBBox()

```
void ftglGetGlyphBBox (
    FTGLglyph * glyph,
    float bounds[6])
```

Return the bounding box for a glyph.

#### Parameters

<i>glyph</i>	An FTGLglyph* object.
<i>bounds</i>	An array of 6 float values where the bounding box's lower left near and upper right far 3D coordinates will be stored.

References [FTGL\\_EXPORT](#).

### 5.35.2.5 ftglGetGlyphError()

Generated by Doxygen

```
FT_Error ftglGetGlyphError (
    FTGLglyph * glyph)
```

**Parameters**

<i>glyph</i>	An FTGLglyph* object.
--------------	-----------------------

**Returns**

The current error code.

References [FTGL\\_END\\_C\\_DECLS](#), and [FTGL\\_EXPORT](#).

**5.35.2.6 ftglRenderGlyph()**

```
void ftglRenderGlyph (
    FTGLglyph * glyph,
    FTGL_DOUBLE penx,
    FTGL_DOUBLE peny,
    int renderMode,
    FTGL_DOUBLE * advanceX,
    FTGL_DOUBLE * advanceY)
```

Render a glyph at the current pen position and compute the corresponding advance.

**Parameters**

<i>glyph</i>	An FTGLglyph* object.
<i>penx</i>	The current pen's X position.
<i>peny</i>	The current pen's Y position.
<i>renderMode</i>	Render mode to display
<i>advanceX</i>	A pointer to an <a href="#">FTGL_DOUBLE</a> where to write the advance's X component.
<i>advanceY</i>	A pointer to an <a href="#">FTGL_DOUBLE</a> where to write the advance's Y component.

References [FTGL\\_EXPORT](#).

### 5.37.2 Function Documentation

#### 5.37.2.1 ftglDestroyLayout()

```
void ftglDestroyLayout (  
    FTGLLayout * layout)
```

Destroy an [FTGL](#) layout object.

**Parameters**

<i>layout</i>	An FTGLLayout* object.
---------------	------------------------

References [FTGL\\_EXPORT](#).

**5.37.2.2 ftglGetLayoutBBox()**

```
void ftglGetLayoutBBox (  
    FTGLLayout * layout,  
    const char * string,  
    float bounds[6])
```

Get the bounding box for a string.

**Parameters**

<i>layout</i>	An FTGLLayout* object.
<i>string</i>	A char buffer
<i>bounds</i>	An array of 6 float values where the bounding box's lower left near and upper right far 3D coordinates will be stored.

References [FTGL\\_EXPORT](#).

**5.37.2.3 ftglGetLayoutError()**

```
FT_Error ftglGetLayoutError (  
    FTGLLayout * layout)
```

Query a layout for errors.

**Parameters**

<i>layout</i>	An FTGLLayout* object.
---------------	------------------------

**Returns**

The current error code.

## 5.41 FTOutlineGlyph.h File Reference

```
#include <FTGL/ftgl.h>
```

### Data Structures

- class [FTOutlineGlyph](#)  
*FTOutlineGlyph is a specialisation of FTGlyph for creating outlines.*

### Functions

- [FTGLglyph](#) \* [ftglCreateOutlineGlyph](#) (FT\_GlyphSlot glyph, float outset, int useDisplayList)  
*Create a specialisation of FTGLglyph for creating outlines.*

## 5.41.1 Function Documentation

### 5.41.1.1 ftglCreateOutlineGlyph()

```
FTGLglyph * ftglCreateOutlineGlyph (
    FT_GlyphSlot glyph,
    float outset,
    int useDisplayList)
```

Create a specialisation of [FTGLglyph](#) for creating outlines.

#### Parameters

<i>glyph</i>	The Freetype glyph to be processed
<i>outset</i>	outset contour size
<i>useDisplayList</i>	Enable or disable the use of Display Lists for this glyph <code>true</code> turns ON display lists. <code>false</code> turns OFF display lists.

#### Returns

An FTGLglyph\* object.

## 5.51 FTTextureGlyph.h File Reference

```
#include <FTGL/ftgl.h>
```

### Data Structures

- class [FTTextureGlyph](#)  
*FTTextureGlyph* is a specialisation of *FTGlyph* for creating texture glyphs.

### Functions

- [FTGLglyph \\* ftglCreateTextureGlyph](#) (FT\_GlyphSlot glyph, int id, int xOffset, int yOffset, int width, int height)  
Create a specialisation of *FTGLglyph* for creating pixmaps.

## 5.51.1 Function Documentation

### 5.51.1.1 ftglCreateTextureGlyph()

```
FTGLglyph * ftglCreateTextureGlyph (
    FT_GlyphSlot glyph,
    int id,
    int xOffset,
    int yOffset,
    int width,
    int height)
```

Create a specialisation of [FTGLglyph](#) for creating pixmaps.

#### Parameters

<i>glyph</i>	The FreeType glyph to be processed.
<i>id</i>	The id of the texture that this glyph will be drawn in.
<i>xOffset</i>	The x offset into the parent texture to draw this glyph.
<i>yOffset</i>	The y offset into the parent texture to draw this glyph.
<i>width</i>	The width of the parent texture.
<i>height</i>	The height (number of rows) of the parent texture.

#### Returns

An FTGLglyph\* object.

References [FTGL\\_END\\_C\\_DECLS](#), and [FTGL\\_EXPORT](#).

```

### Data Structures

- class [FTTriangleExtractorGlyph](#)  
*FTPolygonGlyph is a specialisation of FTGlyph for creating tessellated polygon glyphs.*

### Macros

- #define [FTPolyGlyph](#) [FTPolygonGlyph](#)

### Functions

- [FTGLglyph \\* ftglCreateTriangleExtractorGlyph](#) (FT\_GlyphSlot glyph, float outset, int useDisplayList)  
*Create a specialisation of FTGLglyph for creating tessellated polygon glyphs.*

## 5.53.1 Macro Definition Documentation

### 5.53.1.1 FTPolyGlyph

```
#define FTPolyGlyph FTPolygonGlyph
```

Definition at line 73 of file [FTTriangleExtractorGlyph.h](#).

## 5.53.2 Function Documentation

### 5.53.2.1 ftglCreateTriangleExtractorGlyph()

```
FTGLglyph * ftglCreateTriangleExtractorGlyph (
    FT_GlyphSlot glyph,
    float outset,
    int useDisplayList)
```

Create a specialisation of [FTGLglyph](#) for creating tessellated polygon glyphs.

#### Parameters

<i>glyph</i>	The Freetype glyph to be processed
<i>outset</i>	outset contour size
<i>useDisplayList</i>	Enable or disable the use of Display Lists for this glyph <code>true</code> turns ON display lists. <code>false</code> turns OFF display lists.

#### Returns

An `FTGLglyph*` object.
